Valmy, *vill.* in the dep. of Marne, France, 30 m. N.E. of Châlons.

Valparaiso, *prov.*, Chili; area 1,637 sq. m., p. 286,050. Cap. V., *c.* and *spt.*, the most imp. port on the Pacific cat. of S. America, and the greatest mfg., commerc. and industr. centre of the Republic of C.,

- p. 128, 260; also name of a bor. Porter co., Indiana, U.S.A., clock manuf. and mch. wks., p. 6, 8, 24.
- Valton**, *viz* in Skye, about 133 m. from Portree, p. 364.
- Van**, fort. c. on E. side of L. Van (salt, 75 m. long), Turkish Armenia, S. of Erzeroum; military str.; massacres 1895 and 1896, p. 30,000. Cap. vilayet V., on Persian border; area 15,440 sq. m., mtous. and pastoral, sulphur springs, petrol. wells, p. nearly 300,000.
- Vancouver**, *isl.* off W. coast Brit. Columbia (278 m. long, 50 m. to 65 m. wide), p. 41, 100. Is. separated from the mainland by Queen Charlotte Sound, Johnstone Strait, and the Strait of Georgia. The shores are to a large extent rocky, but are relieved by numerous fine harbours. There are large forests yielding an abundance of timber, but only a small proportion of the land—perhaps a tenth—is available for agricultural purposes. Fruit culture, however, is profitably carried on in many sections of the island and in this direction the developments have been very considerable in recent years. The fisheries of Vancouver Isl. are also important. Gold, silver, copper, and iron are found in paying quantities, and there are excellent coalfields. Cap. Victoria, at S. end of isl., which is also cap. of colony; also name of a spt. in Brit. Columbia, terminus C. P. Ry. on Burrard Inlet, p. 330, 114; also c. Clarke co., Washington, U.S.A., nr. Portland; forest regn. and tr. centre for Hudson B., with military post at Fort Vancouver, p. 447, 8.
- Vannes**, *chf.* dep. Morbihan, France, on S. coast Brittany; shipbldg., ironwks., breweries, p. 25, 114.
- Vannes**, or **Vannes**, *viz* subn. (S.) to Paris, France; linen-leaching, p. 6, 410.
- Van Wert**, *cap.* of Van Wert co., Ohio, 27 m. W.N.W. of Lima, p. 6, 561.
- Var**, R. France, dep. Alpes-Maritimes, flows 60 m. S. to the sea; also dep. S. France, on the Mediterranean; area 2,323 sq. m., pasture, vineyds., sericulture, p. (increasg.) 330,064. Cap. Draguignan, Toulouse largest c.
- Varallo**, *t.* in Italy, 35 m. N.W. of Novaro, p. 3, 510.
- Varanger Fjord**, *del.* of the Arctic Ocean into Finnmark, Norway's most northerly prov.
- Varese**, *t.* nr. Milan, N. Italy; beautifully situated Lombard autumn rest., silk-spinning, gd. wme, p. 10, 445.
- Varinas**, *a t.* of Venezuela, 100 m. S. of L. Maracaybo, p. 7, 100.
- Varna**, fort. *t.* Bulgaria, on Black S.; *chf.* spt. of the country, with gt. grain tr., p. 20, 886.
- Varzin**, *viz*, in Fomerania, 25 m. S.E. of Kōsin. Prince Bismarck's country seat was near this place, p. 1, 300.
- Vasa**, *prov.* grand duchy of Finland, Russ.; area 1,684 sq. m., p. 460, 244. Cap. V., t. and port on G. of Bothnia; oats, butter and cattle export, p. 14, 118; officially called Nikolaistad since the gt. fire and rebuilding of the t. in 1895.
- Vásárhely**, or **Hodmező Vasárhely**, *t.* on L. Hodós, nr. Szegedin, Hungary; wine and tobacco manuf., p. 54, 125. [Hungary, nr. Veszprém, p. 4, 978.]
- Vasárhely**, or **Somogy Vasárhely**, *t.* on R. Torna, Vasilkov, *t.* (indust.), govt. Klev. Russ., p. 18, 829.
- Vaskut**, *viz* nr. Baza, co. Bacs, Hungary, p. 6, 731.
- Vattila-gundu**, *t.* Madras dist., Madras, India, p. 14, 433.
- Vaucluse**, *dep.* S.E. France, area 1,368 sq. m.; agr., vines, sericulture; p. 235,000 (decling.). *cap.* Avignon (*q.v.*). At the village of Vaucluse lived Petrarch, and here it was that he wrote many of his poems to Laura, who was a Frenchwoman living at Avignon. In this sequestered spot the poet devoted his genius to the immortal task of celebrating his passion in worthy verse.
- Vaud**, or **Pays de Vaud**, *cant.* W. Switzld., N. of L. of Geneva, area 1,247 sq. m.; timber forests and vineyds.; p. 300,000; *cap.* Lausanne (*q.v.*). The canton extends from the Jura to the Bernese Oberland. Its population is mainly Protestant, and wine is its principal product.
- Vauxhall**, *district*, *and* S.W. London, nr. Thames; *chf.* centre *pp.* *viz* *isl.* In the 18th and early part of the 19th century Vauxhall was famous for its gardens, where concerts and brilliant assemblies took place, and rank and fashion largely patronised the entertainments. Here the leading vocalists of the time made their appearance, and the *Wax*, balls, fireworks, balloon ascents, and other attractions drew large crowds.
- Veicht**, *arm* of R. Rhine, prov. Utrecht, Holland, flows from the Old Rhine (18 m.) to the Zuyder Zee.
- Veglia**, *del.* in the Adriatic, belonging to Austria, S.E. of Trieste, area 265 sq. m., p. 22,000.
- Vell** was one of the 12 *chefs* of the Etruscan confederacy, and was situated 12 m. N.W. of Rome. After many desperate conflicts with Rome, Vell was ultimately captured, 396 B.C., by Camillus, but not until it had withstood a siege of two years.
- Véja de la Frontera**, *t.* on R. Barbate, Cadix prov. Spain; beautiful agr. and stock-rear. country; p. 22, 106. [15,869.]
- Vejle**, *stet.* Jutland, Denmark; gd. harb., and tr.; p. Valbert, *t.* nr. Barmen, govt. Düsseldorf, Prussia; Industri; p. 11, 979.
- Veldes**, a summer *lake resort* in the prov. of Carniola, Austria, 30 m. N.W. of Laibach; celebrated for its sun-baths; p. 540.
- Veles**, *t.* nr. Tunja, Colombia; gd. tr.; p. 9, 425.
- Velaz Malaga**, *t.* in the prov. of Malaga, Spain, famous for its abundant crops of raisins, sugar, and olive oil.
- Velaz Rubio**, *t.* in the prov. of Almeria, Spain, in the Sierra Maria Mtns., commanding from its eminence an immense view of the country around.
- Velliko Mikhailovica**, *t.* in govt. Kursk, Russ.; grain and timber; p. 1, 300.
- Vellish**, *t.* nr. Dölna, govt. Vitebsk, Russ., p. 18, 170.
- Velletri**, *t.* at foot of the Alban hills, nr. Rome, Italy; good wine; p. 17, 368. At this spot Garibaldi gained a victory over the King of Naples, May 19, 1849. There is a cathedral of some historic note here, dedicated to St. Clement, and dating from the 12th century.
- Vellore**, *t.* on R. Palai, N. Arcot div. Madras, Brit. India; military cantonment, perfume distillery; p. 44, 105. There was a serious outbreak in 1866 by Sepoy soldiers, who mutinied, and put many European officers and residents to death.
- Vendaisais**, an anc. French co. betw. the Durance and the Rhône, now incorporated in Venduse.
- Vendée**, or **La Vendée**, *dep.* W. France, on B. of Biscay, area 2,694 sq. m.; agr., pasturage, vineyds., fishery, sea-salt, and some manufs.; p. (increasg.) 441,000; *cap.* La Roche-sur-Yon. The Vendéens, it will be remembered, offered a strong resistance to the French Revolutionists of 1793. Also *V.*, a R. in dep. same name, flows (46 m.) to Sèvre-Niortaise.
- Vendôme**, *t.* on R. Loire, dep. Loire-et-Cher, France, nr. Tours; industri.; p. 9, 848. Once gave the name to a county and duchy, the former dating from 1255, the latter from 1595. Vendôme has the ruins of a famous Renaissance abbey, a church of the Trinity going back to the 12th century, and some remains of an 11th century castle belonging to the Dukes of Vendôme.
- Vener**, or **Wener**, the largest of the Swedish lakes, 2,150 sq. m. in extent, discharging itself on the S. through the Göta.
- Venetia**, *compartimento* N.E. Italy, betw. the Alps and the Adriatic, area 9,476 sq. m., p. 3, 527,000; embraces provs. Vicenza, Verona, Venice, Udine, Treviso, Padua, Belluno, and Rovigo (all of which see sep.); *cap.* Venice.
- Venev**, *t.* in govt. Tula, Russ., p. 5, 812.
- Venezuela**, *República* S. America, on Caribbean cst. adjoining Brazil, area 394,000 sq. m.; agr., coffee, cocoa, and sugar-growing, stock-raising; p. 2, 800,000; *cap.* Caracas (*q.v.*). Venezuela is very mountainous, and includes vast extents of lake, swamp, and forest. The Andes extend through the country from the south of Lake Maracaybo to the Cordillera de Merida (15,500 ft.). There are eight separate river systems, the chief of which is the Orinoco. Formerly there were several active volcanoes in the country, but these long since ceased to be a menace. Earthquakes are not infrequent, and occasionally cause great disaster. The population is mostly half-breeds, pure negroes or whites being comparatively few. In later years the mineral resources

- of Venezuela, which are exceedingly rich, have attracted much European capital and labour, and the commerce of the country has become very active and important.
- Vengurla**, *cf.* Ratnagird dist., Bombay, India, p. 19,142, ceded to Britain in 1818.
- Venice**, maritime c. Italy, at head of the Adriatic, situated on 80 isls. in the lagoons; splendid arch. rich in art treasures and historic associations; great com. and industr. activity; p. (exclusive of garrison) 175,000. In shipbuilding to-day Venice ranks next after Genoa among Italian cities. Austria became possessed of Venice on the apportioning of the old Napoleonic possessions, but the Venetians, led by Daniele Manin, rose against their oppressors in 1848-9, when the struggle for Italian independence really began; but it was not until 1866 that Venice was able to free itself from Austrian rule and become part of the new kingdom of Italy. Also prov. Italy; area 934 sq. m., p. 465,416. [p. 14,652.]
- Venlo**, Dutch t. on the Meuse, 20 m. W. of Crefield, Vennach, *loch*, Perthshire, Scotl. (33 m. long), expansion R. Teith. [industry; p. 8,804.]
- Venosa**, t. in prov. Potenza, Italy; cathedral, pottery Ventimiglia, t. and coast resort nr. Nice, Italy, p. 5,619. Cathedral and Roman antiquities.
- Ventnor**, salubrious port, *cf.* S. coast Isle of Wight, p. 1,971; 12 m. W. of R. Southampton, beautiful scenery, mild climate, much resorted to by invalids in winter.
- Vera**, t. in prov. Almería, Spain, nr. coast, p. 8,964.
- Vera Cruz**, c. and port Gulf of Mexico prov. Vera Cruz, Mexico; exports ores, precious metals, textiles, raw cotton, and petrol; p. 29,717. V.C. prov. has area 29,210 sq. m., p. 1,000,000. Contains volcano Orizaba (*q.v.*). Fine new harbour, waterworks and drainage constructed in recent years.
- Vercelli**, t. on R. Sesia, Novara prov., Piedmont, Italy; university, fine church S. Andrea; large rice export; p. (including garrison) 35,448. Is a great railway centre, and possesses a fine museum of Roman antiquities.
- Verden**, t. on R. Weser, Hanover, Prussia; Gothic cathedral dating from the 13th century, and of great interest for its architectural beauty and historic associations; p. 10,112.
- Verdun**, fortif. t. on R. Meuse, France; 12th century cathedral, confectionery, liqueur, and hardware factories; p. (declining) 13,450; t. *pub.* Can., p. 12,000.
- Vereeniging**, t. in Transvaal Colony, on the Vaal, 35 m. S. of Johannesburg; the peace treaty between the British and the Boers was signed here May 31, 1902.
- Vergara**, t. on R. Deva, in Basque prov., Guipuzcoa, Spain; quaint old houses, thriving modern manuf. (paper and textiles); p. 6,615.
- Veria**, t. in vilayet of Salonica, Turkey, 40 m. W. of the city of Salonica. In ancient times it was known as Berrhōa, and was one of the chief Macedonian towns. St. Paul preached at Berrhōa in 54 A.D. By the Turks it is called Katerini; p. 8,900.
- Verkhne-Dneprovsk**, t. nr. Ekaterinoslav, Russia; flour mills; p. 12,460.
- Verkhoyansk**, t. in the Yakutsk prov. of E. Siberia, on the Yana R., 400 m. N.N.E. of the city of Yakutsk. It has the reputation of being at the coldest part of the Asiatic continent, with a mean winter temperature of 55° F.; p. 360.
- Verkhue-Udinsk**, t. E. Siberia, Asiatic Russia, at junction of R. Selenga and Uda, nr. Lake Baikal; good trade, great annual fair; p. 9,822.
- Verkhue-Ural'sk**, t. on Upper Ural R., govt. Orenburg, Russ.; tanneries, distilleries, tr. with Kirghiz Cossacks; p. 13,205.
- Vermont**, New England, st. U.S.A., nding. Quebec prov., Canada; area 9,595 sq. m., traversed by the Green Mtns., p. 30,648; agr., mills, and manuf. Cap. Montpelier (*q.v.*). Vermont lies W. of New Hampshire, and is the only entirely inland State of New England. It derives its name from the Green Mountains (Vermont), four of whose peaks have an altitude of over 4,000 ft., but are green to their tops. The minerals of the State include granite, marble, and slate, of which there are extensive quarries; and the proportion of area devoted to cereals is larger than that of any other New England State. It excels
- in maple-sugar production, its yield of which nearly equals one-third of the total production of the country. Champlain was the first white man to set foot in Vermont. This was in 1609, and the first permanent settlement was established at Battleboro in 1724. Vermont is the fourteenth State of the Union, and took its place among the States in 1791.
- Vernon**, t. on R. Seine dep. Eure, France, p. 8,015. Also t. (containing Rockville c.) Tolland co., Connecticut, U.S.A.; manuf. silks, cotton, and woollens; p. 8,546.
- Vernoye**, t. Russn. Turkestan, cap. Semiretchinsk govt.; large tr.; p. 12,500.
- Verona**, fortif. c. on R. Adige, Venetia, Italy; beautiful cathed.; Roman antiquities; palace of the Scaligers (now law courts and gaol); active tr. and industries; p. 82,000; also prov. of Venetia comparto; area 1,188 sq. m., p. 475,416. The historic, artistic, and literary associations of the city of Verona are of high importance. It is one of the cities of the Quadrilateral, and a fortress of the first class. Its ancient amphitheatre, which belongs to the 2nd or 3rd century A.D., has a lesser diameter of 404 ft. There are also remains of Roman gateways and a theatre. The cathedral is of the 12th century, and possesses an altar-piece by Titian; and there is a Romanesque basilica (St. Zeno), a larger and finer edifice than the cathedral. The ancient castles of Theodoric and the Scalas are now utilised for military purposes, and the tombs of the Scala family, with their exquisite wrought-iron railings (1350-80), are among the wonders of the city. The picture gallery of Verona contains some noted examples of the art of the Paduan, Venetian, and Veronese schools. Verona was the birthplace of the poet Catullus and of the painter Paul Veronese, and was the scene of Shakespeare's *Romeo and Juliet* and *Two Gentlemen of Verona*.
- Versailles**, c. Seine-et-Oise dep., France, 12 m. W.S.W. of Paris; famous royal palace; here King William of Prussia was proclaimed German Emperor in 1871, after the Franco-Prussian War; mkt. gdng; distilleries, etc., p. 61,000. Versailles is the see of a bishop, and has a public library of 50,000 volumes. Its famous royal palace, now a great public show-place, was built by Louis XIII. (though on a comparatively small scale at first) on the site of an ancient priory. It was Louis XIV., however, who caused it to be extended to something like its present proportions, under the superintendence of Mansard, and the palace continued to be the favourite royal residence down to the Revolution of 1789. It was Louis Philippe who converted the palace into a public museum. Its pictures include many of the best battle-pictures which French art has produced, those by David, dealing in the main with Napoleon's various campaigns, being of chief interest.
- Vesec**, fortif. t. nr. Temesvár, Hungary, p. 25,114.
- Vesulam**, on R. Vesur opp. St. Alban, Hert., Eng.; site of ancient Roman c. [centre; p. 52,48.]
- Verviers**, t. nr. Liège, Belgium; gt. cloth manuf.
- Vervins**, t. in the dep. of Aisne, France, 26 m. N.E. of Laon, p. 3,429.
- Vesenskaya**, t. in prov. Don Cossacks, Russ., on R. Don, in gdng. and cattle-breeding dist; p. 30,460.
- Vesoul**, t. nr. Besançon, Haute-Saône dep., France, on R. Durance; p. (com.) 10,088.
- Vesuvius**, famous active volcano, S. Italy, on side of Bay of Naples; alt. 3,958 ft. Its eruption in A.D. 79 destroyed Pompeii and Herculaneum, and frequent eruptions have since occasioned havoc. The last serious eruption took place in 1906, when two villages were destroyed by streams of lava and falling ashes, and even doing damage to roofs in Naples. The slopes of Vesuvius are exceedingly fertile and include some choice vineyards, from whose produce high-class wines are made. An observatory was built at the foot of the crater in 1844, which for nearly thirty years was presided over by Professor Palmieri, who contributed much to the advancement of astronomical and meteorological science by his observations. A funicular railway from the base of the mountain to the edge of the crater has existed since 1880.

Vassprism, industr. & nr. Buda, Hungary; large tr. in grain and wine; p. 13,816.

Vevey, & on L. of Geneva, cant. Vaud, Switzld., p. 10,125. Vevey is a charmingly picturesque health resort, 11 m. E. ofusanne, and on the N. shore of Lake Geneva. The English regicides, Ludlow and Broughton, are buried in the old church of St. Martin's here, which dates from the 15th century.

Vexjö, & cap. of Kronoberg co., Sweden, 60 m. W. by N. of Kalmar. Among the local industries match-making and iron-founding are the chief; p. 7,456.

Vézère, R. France, trib. (100 m.) of R. Dordogne.

Via-Mala, a famous Rhine gorge nr. Thusis, canton Grisons, Switzerland; the road and the river intertwine in the most picturesque fashion, showing half-open galleries and tunnels, with precipitous rocks on either side, many to a height of 1,600 ft. in places.

Vianna do Castelo, sp. Portugal, at mth. of R. Lima, nr. Oporto; manuf. lace and milk foods; exports lampreys and salmon; p. 10,114; also name of dist.; area 866 sq. m., grows wine; extensive butter-dairy; p. 225,600.

Viareggio, sea-bath, *rest.*, on the Mediterranean nr. Pisa, Tuscany, Italy; p. 17,116. Here there is a monument to the poet Shelley, whose body was washed ashore at Viareggio after he was drowned.

Viatska, R. Russ., trib. (500 m.) of R. Kama; also govt. Rost. (area 29,117 sq. m., p. 3,105,000), and t. cap. same, on R. V., p. 26,119; gd. trade. (p. 12,444).

Viazna, & in Smolensk govt., Russ.; industr.;

Viborg, govt. in S.E. Finland, Russ., on B. of V., G. of Finland; area 16,627 sq. m.; p. 250,184. Cap. V., t. 85 m. N.W. St. Petersburg; castle, great timber export; p. 22,480; also old mkt. t. in mid-Jutland, Denmark; cathedral; distilleries, cloth factories, iron foundries; p. 8,812.

Vicenza, & on R. Bacchiglione, 40 m. W. of Venice, Italy; fine cathedral, and for Palladio; silk-spinning, majolica, and textile industries; piano, watch and furniture making industries; p. 51,510. Many of the fine buildings of Vicenza were built by Palladio, who was a native of Vicenza. A beautiful campanile, 270 ft. high stands in the centre of the Piazza dei Signori, a very large and handsome square. The Duomo is a fine Gothic structure of the 13th century. Also N. of prov. of Venetia comp., Italy; area 1,052 sq. m.; p. 500,000.

Vich, or Vigue, & nr. Barcelona, Spain; cathedral, flourishing manuf.; p. 12,140.

Vichy (or Montiers-les-Bains), *wat. M. dep.* Allier, France, 35 m. S. of Moulins, mineral springs, large export of waters; p. 14,500 (annual visitors nearly 50,000). The famous Vichy waters were known to the Romans, as is evidenced by the remains of marble baths still existing. Napoleon III. did much to popularise both the resort and the waters. The latter rise in copious springs at the foot of the volcanic mountain ranges of Auvergne, and are used both for medicinal consumption and for bathing.

Vicksburg, & Warren co., Mississippi, U.S.A.; on cliffs above a "cut-off" L. on M. R.; mfg. centre in cotton and timber region; prominent in American Civil War, Confederate surrender 1863; p. 20,814.

Victoria, state of the Australian Commonwealth, separated by R. Murray from N.S.W. on N. Area 87,884 sq. m., mtuous., with fertile plains, and fine forests; agr., stock-raising, gold-mining, etc.; p. 1,337,000. Exports—wool, corn, flour, etc. Cap. Melbourne (p. 21). Victoria is, next to Tasmania, the smallest State of the Australian Federation. Seen as early as 1770 by Captain Cook, it was not until 1801 that the harbour of Port Phillip was discovered, and was not permanently taken possession of and colonised before 1835. From 1836 to 1851 Port Phillip was administered from Sydney, but in the latter year was constituted as the colony of Victoria. The colony has an extreme length of 420 m. from E. to W., while its greatest breadth is only 230 m. It has a coast line of 600 m. From 1851, when gold was first discovered in Victoria, it has been a very productive gold region, being responsible for more than half the yield of all Australia, over £300,000,000 worth of the precious

metal having been obtained altogether up to the present time. Victoria has also contributed largely to the world's wealth in its wool production, its flocks of sheep numbering some 12,000,000 animals. Its chief cereal crop is wheat. There are five different railway systems in the colony, controlling over 3,000 miles of line. Also cap. Brit. Columbia, on isl. Vancouver (p. 21), p. 32,000; also sp. and ch. t. Hong-Kong, on N.W. coast; immense tr.; p. 135,000. Also t. on R. Uruguay, Entre Rios, Argentina, p. 4,827; also sp. cap. Espírito Santo, Brazil, p. 5,814; also t. nr. Caracas, Venezuela, p. 7,952; also vil. on Huon R., Tasmania, p. 3,411; also t. on Guadalupe R., Victoria co., Texas, U.S.A., p. 3,855.

Victoria, East, div. C. Colony, Brit. S. Africa; area 270 sq. m.; p. 9,874. Chf. t. Alice.

Victoria Lake, on Pamir highland, 13,870 ft. above sea-level, is 17 m. long and 3 m. broad; and is supposed to be the chief source of the Oxus. It occupies a section of the Pamir frontier between Russia and Afghanistan.

Victoria Land, *terr.* in Arctic regions, S.E. of Prince Albert Land; also region of the Antarctic, discovered by Ross in 1841.

Victoria Nyanza, largest known lake of Africa, lies on the Equator; area 25,000 to 26,000 sq. m., discharging to the N. by R. Nile, 3,705 ft. above sea-level. This far-extending sheet of water was discovered by Captain Speke in 1858, the story of his finding it and his description of its principal features causing a considerable sensation when published. Subsequently, in 1861-2, he and Grant visited it; and later (1875 and 1889) Stanley explored it, and added greatly to our knowledge of the lake. The Kagera is the chief feeder of the lake, whose native name is Ukerewe. There is to-day railway connection between the lake from Port Florence to Mombasa on the Indian Ocean. The entire east of the lake and lands was surveyed in 1906 by Commander Whitehouse.

Victoria, West, div. Cape Col., Brit. S. Africa; area 15,815 sq. m., p. 15,116; cap. V. W., t. 410 m. N.E. Cape Town; p. 864.

Vienna, & on branch of R. Danube, Lower Austria, cap. emp. Austria; university, fine cathedral, St. Stephen, Rathaus, Parliament bldg., magnif. Prater park, immense industr. activity, thriving commerce and manuf.; p. (including garrison) 27,000 strong; 2,201,100. Vienna is one of the most strictly modern cities of Europe, its Inner City and Ringstrasse forming very handsome and fashionable quarters. The Cathedral of St. Stephen (1300-1510), with a steeple 450 ft. high; the Imperial Palace, the Hofburg; and numerous palaces of the Austrian nobility, are among the striking features of the Inner City; and in the Ringstrasse are the chief public and commercial buildings, including the Exchange, the Rathaus, the Parliament House, the Law courts, the Imperial Museum, and the University. Of Vienna's many public parks, the Prater, 7 sq. m. in extent, is the chief; it was opened in 1766. Maria Theresa, Maria Antoinette, Johann Strauss, Czerny, Schubert, and Baron Hubner were natives of Vienna.

Vienne, R. France, trib. (220 m.) of the Loire; also dep. W. France, watered by R. V.; area 2,712 sq. m., agr. and vineyards; p. (decling.) 333,516; cap. Fontiers. Also t. in dep. Isère, France, nr. Grenoble, on R. Rhone; textile ind. and glove factories; p. 23,208.

Vienne, Haute. (See Haute-Vienne.)

Viersen, & nr. Dusseldorf, Rhensh. Prus.; velvet, plush, silk, and cotton industries; p. 25,125.

Vierzon, industr. & nr. Bourges, dep. Cher, France, p. 10,116.

Vigan, & nr. Nîmes, dep. Gard, France, p. 5,615; also t. in S. Illocos, prov. Luzon, Philippine Is.; agr. and local industries; p. 19,416.

Vigevano, an Italian cathedral c., 22 m. N.W. of Vigò, fort. & t. on Rio del Vigò, prov. Galla, Spain; imp. fishery and shipping industries; p. 27,810. Vigo has often been subjected to attack. It was taken by Drake in 1582 and again in 1589; by Lord Cobham in 1719; and the combined British and

- Dutch fleets, under Sir George Rooke and Admiral *Val Almonde*, captured or destroyed a combined Spanish and French fleet here in 1704.
- Vijayanagar**, a ruined city in the Bellary dist. of the Madras Presidency, India, 40 m. N.W. of the city of Bellary. From the 14th to the 16th century Vijayanagar was the capital of a Hindu kingdom.
- Vilkomir**, *t.* in Kovno govt., Russ., nr. Vilna; *gd. tr.*; p. 16,897.

- Virginia**, an Atlantic st. U.S.A., S. of Maryland; area 44,450 sq. m.; tobacco culture, p. 2,062,197; cap. Richmond (*g.v.*). Virginia is separated from Maryland by the Potomac R. and Chesapeake B. From E. to W. its greatest length is 475 m.; its greatest width 190 m. The Appalachian Mtns. on the W. are of low range. Besides the Potomac, the chief rivers are the Kappahannock, the York, the James, the Blackwater, and the Roanoke. Virginia is famous for its Natural Bridge in Rockbridge co., and for its mineral springs. "Virginia leaf" tobacco is the finest quality that the United States produces. It was at Jamestown in this state that the first representative assembly in America was held, and its early history is full of romantic incidents. In the struggle for independence, Virginia took the lead, and provided men like Washington, Jefferson, Madison, and Patrick Henry to do battle for the cause. In the civil war it furnished the great Confederate commander, Robert E. Lee, and on its soil the last battle of the war was fought and the final surrender made. (See also W. Virginia.)
- Virginia City**, on R. above Mt. Davidson, Nevada, U.S.A., alt. 6,205 ft. above sea; silver mining dist., p. (much decreased) 3,124.
- Virginia Water**, artificial L. nr. Windsor Park, 23 m. S.W. London, Eng.; residential dist., p. 1,462.
- Virgin Isles**, *gvp.* in the W. Indies, E. of Porto Rico, comprising a pres. of the Brit. Leeward Isl. Col. certain dependencies, of Porto Rico, and the isls. St. Croix, St. Thomas, and St. John (all of which see). Total area 275 sq. m., p. 56,000.
- Vishni-Volotchok**, *t.* Tver govt., Russ.; *gt. local tr.*, p. 16,418.

- Vivero**, *t.* prov. Lugo, Galicia, Spain; good coasting trade and fishery; p. 12,824.
- Vizagapatam**, *dist.* Madras, Brit. India, area 17,225 sq. m.; rice, millet, oil-seeds; p. 3,000,000. Cap. V., *spt. t.* exports rice and sugar, weaving and ornamental wood box-making; p. 35,028.
- Vizeu**, *dist.* Portugal (anc. prov. Beira Alta), area 1,020 sq. m., p. 410,500. Cap. V., *t.* nr. Oporto; cathedral, Roman ruins; p. 6,065.
- Vizianagram**, *t.* in Vizagapatam dist., Madras, India, nr. the spt. of Bidadipatam; res. of the first Hindu nobleman of Madras, many fine buildings, good *tr.*; p. 33,864.
- Vlaardingen**, fishing *t.* on R. Maas, Holland, nr. Rotterdam, p. 11,183. The herring fleet of V. is large and important, and is responsible for much of the town's prosperity.
- Vladikavkaz**, fortif. *t.* on R. Terek, N. Caucasus,

Russ.; *impt. mill. centre* (garrison 12,000, besides Cosacks), many factories and distilleries; stands at the foot of the main Caucasian chain and is an important railway terminus; p. 55,000 (3,000 only in 1860).

Vladimir, govt. Central Russia, between Nijni Novgorod and Moscow, area 18,864 sq. m.; *manuf. and agr.*; the govt. is, next to St. Petersburg and Moscow, the most prosperous in the country from an industrial point of view, the various textile manufactures of cotton, woollens, worsteds, linen and silk being carried on very extensively. Fruit culture is also a flourishing industry. The chief minerals are alabaster, porcelain clay, and limonite; the soil, which is generally of a sandy nature, produces oats, rye, millet, barley, flax and potatoes. There are numerous lakes and marshes; p. 1,900,580. Cap. V., old c. on R.'s Lybed and Klyazma; p. 30,875. There are many ancient buildings of interest, including the cathedral of the Assumption (1158), the church of St. Demetrius (1597), the church of the Nativity (1519), containing the tomb of St. Alexander Nevski, the archiepiscopal palace, formerly the convent of the Nativity, and the "golden gate" or triumphal arch, built in 1198, and restored under Catherine II. Vladimir was founded in 1116 by Vladimir Monomakh, becoming the capital of a line of grand princes who succeeded to those of Kiev among Russian rulers.

Vladimir-Volynsk, t. in govt. Volhynia, nr. the frontiers of Russia proper, Poland, and Galicia; large churches (ruined); frequently besieged by Tartars; p. 9,854.

Vladivostok, chf. Russian spt. and naval station on the Pacific. Cap. of the viceroyalty of E. Asia, Siberia; terminus of the Trans-Siberian rly.; p. 62,000. The harbour of Vladivostok is considered to be one of the finest in the world. It was founded as a port and station in 1861.

Volon, t. nr. Grenoble, dep. Isère, France; p. 12,460.

Volons, Loc. mtn. range Haute-Savoie dep., France, 20 m. E. Geneva; highest summit, 4,873 ft.

Volcan de Agua, conical mtn. nr. Guatemala t. Central America; discharges water, destroyed Old Guatemala by flood in 1541; alt. 12,197 ft.

Volcano Iala, three smt. Japanese isls. in the Pacific, named Iwo-jima, Minami-Iwo-jima, and Kita-Iwo-jima; latter is largest and most N.; Minami-Iwo-jima (the most S.) rises 3,000 ft. from the water.

Volchansk, t. in Kharkov govt. Russ., nr. Bylegorod; tanneries and distilleries; p. 12,862.

Volga, R. Russ., rises on Valdai plateau, govt. Tver, flows in a serpentine course 2,325 m. to the Caspian at Astrakhan; has very heavy traffic over a navigable length (with canals and trib. Ra.) of nearly 20,000 m. The waters are frozen in winter and traffic is suspended. It has important fisheries. Among its tributaries are the Oka, Kama, Mologa, and Vitka. The principal towns on the Volga are Jaroslavl, Kostroma, Nijni Novgorod, Kazan, Simbirsk, Stavropol, and Samara.

Volhynia, govt. S. W. Russ., on Austrian frontier, area 57,473 sq. m., p. over 3,000,000. Forest land in N., agr. S.; *gdng.*, bee-keeping, stock-raising, also many factories; there are deposits of porcelain clay, iron ore, krollin, coal, lignite, graphite, jasper and amber, and large tracts of black earth; cap. Zhitomir.

Volkov, R., Russ., flows (130 m.) from L. Ilmen to L. Ladoga.

Volkovyak, anc. t. govt. Grodno, Russ.; long the scene of dispute between princes of Lithuania and Volhynia; annexed by the Czar after first divn. of Poland; p. 11,134.

Volo, spt. t. nr. Issa, at head of G. of V. in Thessaly, Greece; *gd. harb. and tr.*; p. 17,145.

Vologda, govt. European Russ., bordering on the Ural Mtns., area 150,498 sq. m., p. (declining) 1,360,500. Forest-clad; *agr. and dairying* in the clearings; there is considerable mineral wealth, salt and iron being

found in abundance; the main industries, however, are connected with timber; and textile factories, oil works, paper-mills, and bristle works are numerous; cap. V., t. on V. R., p. 56,500; large tr. with St. Petersburg in agr. prod. [p. 26,456.

Volak, t. on R. Volga, Saratov govt., Russ.; *gd. tr.*; Volta, R. Upper Guinea, flows (500 m.) from the Kong Mtns. and Ashantee; also smt. t. nr. Mantua, Italy; Austrian victory over Sardinians, 1848.

Volchansk, (See Volchansk).

Volterra, t. nr. Pisa, Tuscany, Italy; the national museum in Tagassi Palace contains a fine collection of Etruscan antiquities, and there is a Romanesque cathedral of great interest, dating from 1120; saline spring, alabaster industries, p. 7,814.

Voltri, cat. t. nr. Genoa, Liguria, Italy, pilgrimage shrine, shipbdg. and ironworks; here Austrians defeated the French under Massena in 1800, p. 7,960.

Voorse, isl. of S. Holland, betwn. mth. of the Meuse and Rhine, Vliet.

Vorarlberg, prov. Austria, W. of the Tyrol, area 2,004 sq. m., hilly, with mtn. valleys; goat and cow-kpg., weaving and embroidery, p. 120,815, cap. Bregenz (g.v.).

Voronezh, govt. S. Russ., area 25,448 sq. m.; agr. stock-rearing, with woodwk. and domestic manufs., p. 3,400,000, principally peasants; among the mineral deposits are porcelain clay, ochre, iron ore, sulphur, and pent; there is a large trade done in market gardening; and the industries include flour mills, sugar refineries, soap works, tobacco factories, iron foundries, and bell-making establishments; cap. V., on V. R. nr. its junctn. with R. Don. Here Peter the Great in 1695 laid the foundation of the Russn. fleet; import comincl. centre, p. 88,568.

Vorontzovka, spt. in govt. Voronezh, Russ.; ride manuf. and *impt. fals.* p. 12,822.

Vorovagaa, vul. co. Saros, N. Hungary; opal mine; a stone, said to be worth a million sterling (now in Court museum at Vienna), was found here.

Vosges, mtn. chain E. France and Alsace-Lorraine, Gerny, 120 m. long, extending from Basel on the N., they run along the left side of the Rhine Valley, and give forth the rivers Saar and Moselle on the N.; highest summit, the Ballon de Guebwiller (g.v.); also E. frontier dep., France, area 2,305 sq. m., agr., dairying, vineys., textile inds., p. (increasing) 400,000; cap. Epinal (g.v.); standing on the Upper Moselle. The mountains are well wooded, and the plains exceedingly fertile, while the deposits of coal, silver, lead, copper, and lithographic stones are extensive. There are also many mineral springs, including those at Plombières and Contrexéville, which are much resorted to by invalids.

Voekresensk, t. in govt. Moscow, Russ., p. 6,724.

Vostitza, a Greek t. on the Gulf of Corinth, 25 m. from Patras, p. 5,412.

Voznesensk, t. on R. Bug, govt. Kherson, Russ.; cathedral, four large fairs annually, distilleries, p. 26,465.

Vranja, t. nr. the Macedonian frontier, Servia; garrison; flax and hemp culture and manuf., p. 22,806; near is the health rest. (warm sulphur springs) of Vranjska Banya.

Vratsa, t. on R. Vratsanska, Bulgaria; wine, silk, jewellery; Tcher Ress atrocities in 1876 and 1877, occasioning bombardment and capture by Russ.; p. 14,874.

Vryb, cap. Brit. Bechuanaland, S. Afr.; goldfield in neighbourhood, p. 5,812. Vrybush occupies a position near a head-stream of the Vaal R. 125 m. N. of Kimberley. It is of growing importance and has many public buildings, including government buildings, churches, schools, hospitals, etc.

Vryheid, chief t. of a col. district in the extreme N.E. of Natal, to which colony it was transferred from the Natal in 1902.

Vulcano, mont S. isl. of the Lipari grp., 12 m. N. of Sicily. [Roumania and Transylvania.

Vulcan Pass, in the Carpathian Mtns., between Vyatka. (See Vyatka.)

Vyasma, t. of Central Russia, 90 m. E.N.E. of

- Smolensk, famous for its manuf. and its gingerbread, p. 18,348.
- Vyerny, fortified. *f. prov. Semirychensk, Asiatic Russ.*, at ft. of Trans-Ili Alatau, alt. 2,430 ft.; destroyed by earthquake in 1887; distilleries, oil wks., etc.; p. 3,116. It is a considerable trading centre, possesses a horticultural college and a cathedral, and has some noted Nestorian inscriptions of the 8th century.
- Vyrrwy, *L.*, art. reservoir, Montgomerysh., Wales, with a dam 1,180 ft. long, furnishing water to Liverpool; 5 m. long, with an area of 1,122 acres. This artificial lake holds 2,203,000,000 cubic feet of water. It was eleven years in construction.

Warwick, English midld. co., contains the Forest of Arden, Stratford-on-Avon, Coventry, and a large portn. of Birmingham; area 902 sq. m.; rich in coal, iron and limestone; p. 1,040,668. Cap. Warwick, c. on R. Avon. Warwick Castle is one of the most interesting historic edifices in the country, standing on a rocky elevation overlooking the Avon. A fortress built by King Alfred's daughter Ethelfleda, stood here in 915, but the present great castle, covering 3 acres, dates from somewhat later times, the oldest portion is Caesar's Tower, 147 feet high, and Guy's Tower, belonging to the 14th century. About 1759 the castle, which had fallen into ruins to a great extent, was restored by the then Earl of Warwick at a cost of £50,000. A fire on 3rd Dec., 1871, destroyed the great Hall, but six years later the damage was made good, and to-day this old feudal castle is one of the finest in the country to be still occupied. Of the many royal edicts who have been entertained within the walls of Warwick Castle may be mentioned Queen Elizabeth, James I., William III., Edward VII., and George V. Large ch. of St. Mary, with Beauchamp Chapel and memorials; p. 11,856; also t. in co. Merivale, Queensland; corn and vineyard dist.; p. 4,014; also cotton mfg. t. Kent co., Rhode Isl., U.S.A., on Narragansett Bay; p. 23,224.

Waseca, *vul.* W. co., Minnesota, U.S.A., nr. Owatonna; p. 6,240.

Wash, *f.* flowing 50 m. from co. Rutland, Eng., to R. Welland, Lincolnsh.; also estuary of R. Welland, Witham, Ouse and Nen; co.'s Lincoln and Norfolk, 22 m. long, width at mth. 14 N. Sea, 15 m. Much land has been reclaimed on both sides of the channel of the Ouse. Rennie, the architect, put forward a proposal to reclaim 150,000 acres by draining the Wash, and the project has been agitated again of late years, but has never been seriously undertaken.

Webb City, Jasper co., Missouri, U.S.A., in lead and zinc regn.; p. 11,565.

Weber Canon, picturesque spot on the R. Weber, trib. of the great Salt Lake, north Utah, U.S.A.; traversed by Union Pacific R.V.

Weberster, t. in Worcester co., Mass., U.S.A., on the French R.; textile and boot factories; p. 6,622.

Wedmore, bor. nr. Axbridge, Somerset, Eng., p. 3,216.

It was at this spot that the treaty of peace was signed between King Alfred and Guthrum the Dane in 878.

Wednesbury, mkt. t. nr. Birmingham, Staffs, Eng.; stoneware, potteries, iron and coal indus. les; p. 5,121 (of partly bor. 76,978). There is an old church dedicated to St. Bartholomew, said to stand on the site of a temple to Woden. This church is of the 12th century, but has been several times rebuilt and restored, little of the original edifice now remaining. A castle was founded at Wednesbury by Ethelred, Edward the Elder's sister. But in spite of these historic associations, Wednesbury is very modern in its general aspect, and owes its prosperity to the mineral resources of the district and the very active part it has played in the development of the iron, steel, machinery, and allied trades.

Wednesfield, t. near Wolverhampton, Staffs, Eng.; lock and key manu.; p. 6,452.

Weerde, industr. t. nr. Limburg, Holland, p. 8,025.

Wei-hai-wei, Brit. naval stn., N.E. co. Shantung penins., China, nr. the treaty port of Chefoo; held under lease; area (includg. the nat. t. with 800,000 p.) abt. 120 sq. m. Harb. and port fortified.

Weimar, c. on R. Ilm, nr. Erfurt, Gerny., cap. of grand-duchy Saxe-Weimar; many learned and scientific instns.; "the German Athens"; Goethe's house contains the Goethe and Schiller archives, and other interesting collections; the Stadtkirche, dating from 1706, contains many interesting tombs, including those of Bernhard of Weimar and Herder; and among the other buildings are the ducal palace as rebuilt in 1790-1803 after being burnt down in 1774, and the court theatre where Wagner's "Lohengrin" was first produced by Liszt; p. 35,480.

Weinberge, t. in Bohemia, Austria, subn. to Prague, p. 54,280; industr. and residnt.

Weinheim, t. on the "Mountain Road" at the foot of the Odenwald, N. of Heidelberg; castles and house of Teutonic Knights; wine, fruit, etc.; p. 12,321.

Weipert, t. on slope of the Erzgebirge, Baden dist., Bohemia; chf. centre of the Austrian lace and fringe-making industry; p. 10,824. [p. 4,424.]

Weir, c. Kansas, U.S.A., in Cherokee co.; industr.; p. 11,416.

Welbeck Abbey, the seat of the Duke of Portland, 3 m. S. of Worksop, Notts, standing in a park 10 m. in circumference. The mansion occupies the site of an old Premonstratensian abbey.

Welland, R. Northants and Lincolnsh., Eng., flows (70 m.) to the Wash. (125 m. long) W. of the Niagara.

Welland Canal, connects Lakes Erie and Ontario.

Welle-Makua, R. of Equatorial Africa, flows W. from nr. Wadatal, the Upper course of the Mbembi or Ubangi R., trib. of the Congo; explored by Stanley, Schweinfurth, and Greenfell.

Wellesley Isls., group in the Gulf of Carpenteria, belonging to Queensland.

Wellingtonborough, mkt. t. on R. Nen, Northants, Eng., 20½ m. E.N.E. of Northampton. It has ancient associations, including a chalybeate spring, the Red Well, to which Charles I. is said to have resorted. In 1798 it was almost destroyed by fire. It contains an old parish church, restored 1851-74; a grammar school, founded in 1505; and a corn-exchange. Iron-smelting is one of the local industries; leather manu.; p. 19,758.

Wellington, mkt. *t.* nr. Shrewsbury, Shropshire, Eng., p. 7,850. Its ancient name was Watling Town, because it stood on the line of Watling Street. Also mkt. *t.* nr. Taunton, Somerset, Eng. This was the town from which the famous warrior duke took his title, the manor, which had been held by King Alfred, Asser, Aldhelm, the Protector Somerset, and the Pophams, being purchased for him in 1813; a considerable industry in woollen and worsted goods is carried on here; p. 7,634. Also *t.* in Hutt co., on Port Nicholson, N. Island, New Zealand, cap. of the col., fine harbour, imp. tr.; Wellington was settled in 1840, and became the seat of government in 1855; its principal buildings are Government House, the House of Legislature, Anglican and Roman Catholic cathedrals, public museum, colleges, etc.; and there is a public park, with botanical gardens, of 100 acres; p. 52,114. Also prov. containing same, 300 m. by 80 m., p. 127,000. Also a cent. pastoral dist. N.S.W., area 16,695 sq. m. Also *t.* on Macquarie R., in W. co., N.S.W., p. 3,216. Also *t.* in Paarl div., Cape Colony, Brit. S. Africa, 45 m. from Cape Town, p. 2,805. Also isl. off W. coast Patagonia (100 m. long), belonging to Chili.

Wellington Lake (area 54 sq. m.), in Gippsland co., Bruce, Victoria; Wellington Mtn., nr. Hobart Town, Tasmania, alt. 4,770 ft.

Wells, *t.* at foot of Mendip Hills, Somerset, Eng.; cathedral, bishop's palace. Wells is a place of great antiquity. The present see was founded by Edward the Elder in 909, although 200 years earlier King Ina established a house of secular canons there. Among its bishops of Wells the names of Wolsey, Fox, Laud, and Ken occur. The cathedral, though small, is considered to be perhaps the most architecturally beautiful of English ecclesiastical edifices, its famous west front, with its 600 matchless sculptured figures, 127 of which are life-size or colossal, being of remarkable beauty and grandeur. The central tower is 160 ft. high, and the two western towers 130 ft.; p. 4,655. Also vil. York co., Maine, U.S.A., p. 3,854.

Wells, or Wells next the Sea, *spt.* *t.* Norfolk, Eng., nr. Holkham Bay, p. 2,565. [10,112]

Wellston, *c.* Jackson co., Ohio, U.S.A., ry. centre, p. Wellsville, *c.* in colly, and farming dist. Columbiana co., Ohio, U.S.A., on the Ohio R., p. 6,400.

Wells, *t.* on R. Traun, nr. Linz, Upper Austria; old castle (in which Emp. Maximilian died, 1551); corn and cattle tr., mchyn., gunpowder, felt and paper factories, *p.* (including garrison) 13,108.

Welshpool, *bor.* on R. Severn, Montgomerysh., Wales, nr. Is Powis Castle, the seat of Earl Powis, the descendant of the Herberts, who owned the castle from the days of Elizabeth, and of the Clives; p. 5,275. One of the Montgomery boroughs.

Welwyn, *par.* of Herts, 5 m. N. of Hatfield. Young, the author of *Night Thoughts*, was vicar of Welwyn, and lies buried in the churchyard.

Wem, mkt. *t.* nr. Shrewsbury, Shropsh., Eng., p. 722.

Wembley, Middx., an urban *dist.* 21 m. E.S.E. of Harrow, p. 10,657. Wembley Park, opened in 1894 as a pleasure resort, is much visited, but the tower, which the late Sir Edwin Watkin, Bart., projected, was only completed to the first stage, and finally pulled down in 1907. The district is now becoming largely residential.

Wemyss, *par.* of Fife, 3 m. N.E. of Dysart, and including the vills. of East and West Wemyss, combined p. 3,800.

Wemyss Bay, *strm.* *river* and hydropathic *rest.* Renfrewsh., Scotl., 8 m. S.W. Greenock.

Wen-Chow, Chinese treaty *port.* in the Prov. of Chekiang, p. over 80,000. [5,814]

Wendel, *t.* on R. Biles, nr. Treves, Rhenish Pruss., p. Wendover, *a par.* of Bucks, 5 m. S.E. of Aylesbury, and lying under the Chiltern Hills. Up to 1832 it returned members to Parliament, p. 2,000.

Wener, large *L.* Sweden, W.N.W. of L. Wetteren, with which it is connected by canal (thence with the Baltic); area 1,740 sq. m., 112 m. long, 18 m. wide, 35 m. almost divided by a peninsula and an isl. *gr.*, the western half being called L. Dalbo.

Wenersborg, *lake port* Sweden, on a tongue of land betw. the R. Gota and the Väsabotten (the

southmost bay of L. Wener); connected by the Dalsland canal with Frederikshald in Norway; mals and paper factories, p. 6,500. Founded in 1642, W. has several times been burnt down. **Wengern Alp**, *a height* in the Little Scheideck pass, Bernese Oberland, Switz.; magnif. view, alt. 6,728 ft.

Wenham Lake, Massachusetts, 22 m. N.N.E. of Boston, famed for its large yield of ice. There is a lake of the same name at Drobak, near Christiania, in Norway.

Wenlock, or Much Wenlock, *c.* Shropsh., Eng.; iron and coal dist., p. 15,224. It is a municipal borough, comprising in addition to Much Wenlock, Broseley, Coalport, Madeley, Ironbridge, and Coalbrookdale, Wenlock was incorporated by Edward IV. in 1448, and returned 20 members to Parliament until 1885.

Wensum, *R.* Norfolk, Eng., trib. (30 m.) of R. Yare. Wentworth Forest, an ancient wooded tract in Mowmouthshire, 41 m. S.S.E. of Usk.

Wentworth Castle, the seat of the Wentworth family, erected 1730-68, 3 m. S.W. of Barnsley.

Wentworth Woodhouse, 41 m. N.W. of Rotherham, in the West Riding of Yorkshire, the seat of Earl Fitzwilliam. In the 17th century it was the home of the ancestor of Fitzwilliams, the great Earl of Stratford ("Thorough").

Wentworth, *t.* in Co. W., on Darling R., N.S.W., pastoral dist., p. 1,864.

Wepener, *c.* nr. Caledon R., on border Basutoland and Orange R. Col., Brit. S. Afr., battle April, 1900.

Werdau, *t.* on R. Pleisse, nr. Zwickau, Saxony; textile and mchy. manuf., p. 21,680.

Werden, *t.* on R. Rhur, in the Rhine Prov., Pruss.; Benedictine abbey; cloth mfg. centre in colly, and quarry dist., p. 11,065. [Pruss., p. 12,608]

Wermelskirchen, industrial *t.* nr. Dusseldorf, Rhenish Westphalia, *t.* on R. Holtenauer, alt. 600 ft. Harz mtns., Saxony prov., Pruss.; castle, p. 10,140.

Werra, *R.* Germany, a headstream of R. Weser; rises in Sixte-Meiningen, and flows (170 m.) through Thuringia to the Fulda at Münden. [dist., p. 1,862]

Werrabee, *vil.* nr. Melbourne, Victoria; pastoral Werriogee, *t.* on the Belgian frontier with considerable tobacco factories, p. 9,300.

Wesel, fort, *t.* Rhine prov., Pruss., nr. Duisburg, on R. Lippe; museum and meteorological stn., p. 53,306.

Weser, *R.* W. Germany, flows from the conflu. of Fulda and Werra R.'s at Münden (270 m.) past Bremen to N.S. east of the R. Elbe at Bremerhaven.

Weser Mtns., terraced nitrous. regn. on both sides of R. Weser, from Münden to Minden; highest pk. 1,650 ft.

Wessex, the ancient kingdom of the West Saxons, including Berks, Hants, Wilts, Dorset, Somerset, Devon, and Cornwall.

West Australia.—(See Australia, Bay.)

West Bay City, on R. Saginaw, Bay co., Michigan, U.S.A., opp. Bay C.; pine-timber industries, p. 13,460.

West Bethlehem, *bor.* Penn., U.S.A., in Clarion co., p. 5,610.

Westboro, *t.* (mfg.) Worcester co., Mass., U.S.A., p. 4,417.

West Boylston, *vil.* nr. Worcester, Mass., U.S.A.; West Bromwich, mfg. *bor.* on R. Tame, Staffs, Eng., nr. Birmingham; mchyn., tools, and metal works; West Bromwich is called *Bromwich* in the Domesday record, and in the 12th century was the seat of a Benedictine priory. There are no relics of olden days remaining, however, the town being of wholly modern aspect, owing its expansion from the position of the small village of a hundred years ago to its present extent and prosperity to the rich fields of coal and iron in its vicinity; p. 68,345.

Westbrook, *c.* on R. Presumpscot, Cumberland co., Maine, U.S.A.; paper, cotton, and silk factories; p. 7,520.

Westbury, old *t.* nr. Salisbury, Wilts, Eng., woollen factories, brickwks. Until 1892 it returned two members to Parliament and was allowed to send one member from that date to 1895, when the privilege was taken from it, and it became incorporated with the county representation. The famous Westbury White Horse, 175 ft. long, is on the S.

slope of Westbury Down, and is supposed to commemorate King Alfred's defeat of Ethandun in 878; p. 3432.

Westbury-on-Severn, *t.* 8 m. S.W. Gloucester, Eng.; industri; p. 1,822.

West Calder, *t.* 2½ m. S.W. Edinburgh, Scot.; p. 4,412.

West Chester, *bor.* in mkt.-gding. dist., Chester co., Penn., U.S.A.; residit. sub., Philadelphia; p. 10,346.

West Cleveland, *sub.* of Cleveland, Ohio, U.S.A., on L. Erie; p. 6,246. (N.E.); industri; p. 40,120.

West Derby, *t. sub.* to Liverpool, Lancs., Eng. (on West Duluth, *vil.* sub. to Duluth, Minnesota, U.S.A., on L. Superior; p. 5,640).

Westeraalen, *grp.* of *isls.* on N.W. cst., Norway, separated from the Lofoten Is. by the Raftund.

Westeraa, *t.* on N. bay of L. Mælar, Westmanland, Sweden; Gothic cathed. (with val. episcopal lib.); 16th centy. castle; p. 12,104.

Westham, *mkt. t.* nr. Sevenoaks, Kent, Eng., on Surrey border; p. 2,784. Birthplace of General Wolfe.

Westerkirk, *par.* in Dumfriesshire, 6 m. N.W. of Langholm.

Westerly, *vil.* on Rhode Isl., 44 m. S.S.W. of Providence, p. 7,800.

Western Isles.—(See Azores and Hebrides.)

Westmorland, *t.* Herrodslee, [p. 14,614.

Westfield, *t.* Hampden co., Mass., U.S.A.; manuf.; West Field, *channel* sep. Lofoten Is. from Norwegian mainland.

West Flanders, *prov.* Belgium, adjoin. N. S. and French border, area 1,249 sq. m. (See also Flanders.)

Westfield, *t.* of Massachusetts, 9 m. W. of Springfield.

Westford, *t. nr.* Lowell, Middlesex co., Mass., U.S.A., p. 4,610.

Westgate-on-Sea, *cst. wat. pl.* nr. Margate, Kent, Eng., p. 4,444.

West Ham, *Parly. bor.* Essex, Eng., subn. to E. London; industri; and residential; bordered by R's Thames and Lea; p. 289,102.

West Hartlepool, *t.* [within Parly. limits of Hartlepool (*q.v.*), Durham, Eng., p. (sep.) 63,932.

West Haven, *bor. subn.* to New Haven c., Connecticut, U.S.A., p. 5,680.

West Hoboken, *t.* on Hudson R. clif., N. of Jersey City, opp. New York, U.S.A.; silk factories; p. 35,403.

West Houghton, *mfg. t. nr.* Wigan, S.E. Lancs.

West India Is., or Antilles, *group* in the Atlantic, extending between the coasts of Florida and Venezuela, separating the Caribbean Sea from the G. of Mexico; comprising the Bahamas, the Greater Antilles (Cuba, Hayti, Jamaica, Porto Rico, and the Caymans), the Virgin Is., the Lesser Antilles (including the Leeward and Windward grps.), and the Is. of Venezuela belonging to that State. From the 17th to the 19th centuries the French, English, and Dutch were in frequent conflict regarding the possession of these various islands.

West Indies, *group* in the Atlantic, secured Martinique, Grenada, St. Vincent, and Guadeloupe between 1635 and 1719; the Dutch obtained Tobago and Curaçao in 1632; and the English took possession of St. Christopher, Barbadoes, Antigua, Dominica, and the Grenadines between 1623 and 1763. Later, England wedded St. Vincent, Grenada, and St. Lucia from the French. (See separate entries.)

West Indianapolis, *t.* in Indiana, U.S.A., subn. to I. city; residential; p. 6,146.

Westland, *prov.* New Zealand (S. is., W. cst.), sep. from Canterbury prov. (of which it was formerly a part) by the Southern Alps; 200 m. long, 30 m. wide, p. 20,000; chf. t's, Greymouth and Hokitika (*q.v.*); muntins, gold mining.

West Lothian.—(See Linlithgowshire, Scot.).

Westmanland, *prov.* Sweden, N. of L. Mælar, area 2,631 sq. m., p. 146,118; cap. Westeraa (*q.v.*).

Westmeath, *indl. co.* Leinster prov., Ireld., area 708 sq. m.; pasture and tillage, with much bog; p. (declining) 59,812; dairying; co. t. Mullingar.

Westminster, *c.* on N. bank of the Thames, Middlesex, Eng., W. of London; contains Houses of Parliament, Westminster Abbey, Government offices, Royal Palaces (Buckingham P. and St. James'), Roman Catholic Cathedral, National Gallery, Tate Gallery

of British Art, and many other fine bldgs.; industri. and residential, as well as official; p. 160,277.

Westminster, *t.* in Maryland (nr. Baltimore), p. 3,822.

Westmount, *t.* Queb., Can., p. 15,000.

Westmorland, *co.* of N.W. Eng., adjoining Cumberland, W. and N., and touching Morecambe B., area 783 sq. m., covering part of the Lake Country (Windermere, Ullswater, Grasmere, etc.); agr., lead-mining, quarrying; p. (slightly declining) 63,575; cap. Appleby; most p. t., Kendal. There are numerous mountains, including Helvellyn (3,118 ft.) on the Cumberland boundary, Bow Fell (2,959), Fairfield (2,950), Dufton Fell (2,803), and Dun Fell (2,780); the moorlands are of great extent, and woods and plantations cover over 17,000 acres.

West Newbury, *vil.* nr. Boston, Mass., U.S.A., p. 3,018.

Weston-super-Mare, *wat. pl.* Somerset, Eng., on an inlet of Bristol Channel, p. 23,235. A hundred years ago it was only a small fishing village, but its sheltered and picturesque situation and bracing air gradually attracted many visitors, and it is now a fashionable resort, with esplanade, promenade pier, and public gardens. [U.S.A., p. 8,124.

West Orange, *industri. t.* Essex co., N. Jersey.

Westphalia, *W. Prov.* Pruss. (former duchy and sometime pt. of a kingdom); adjoins Holland, Hanover, and Rhens; area 7,798 sq. m., dairying, gding., agr., horse-breeding; contains also princip. coalfields of Germany; p. 4,130,000. The archbishops of Cologne, as Dukes of Westphalia, had control of the duchy from 1180 to a much later period. In 1807 Westphalia formed part of the kingdom ruled over by Jerome Bonaparte, and in 1813, when Jerome was deposed, the province as it now exists was assigned to Prussia. The industrial wealth of Westphalia and its modern prosperity have been built up on the rich mineral treasures found beneath its soil, and including iron, copper, lead, zinc, sulphur, antimony, etc. Cap. Munster.

West Pittston, *bor.* in anthracite coal regn. Lackawanna co., Penn., U.S.A.; p. 6,246.

West Point, *military stn.* (seat of the U.S. Military Academy), Orange co., New York, U.S.A., on W. bank Hudson R. [Westport B., p. 4,450.

Westport, *mkt. and spt. t. co.* Mayo, Ireld., on West Frussa, *prov.* F., adjoin. Baltic and Russn. Poland; area 9,248 sq. m., p. 1,500,000. Divided into the govts. of Marienburg and Dantzig (*q.v.*).

West Randolph, *vil.* nr. Montpelier, Orange co., Vermont, U.S.A., p. 3,120.

Westray, one of the Orkney Is., 23 m. by sea from Kirkwall, Scot.; 10 m. long; p. 2,200.

West Russia, part of the Czar's domain comprising the govts. of Grodno, Mohilev, Vilna, Vitebsk, Kovno, and Minsk (*q.v.*). [p. 3,428.

West Rutland, *vil.* in co. R., Vermont, U.S.A.

West Springfield, *t.* (industri.), Hampden co., Mass., U.S.A., p. 8,144.

West Troy, *now Watervliet* (*q.v.*).

West Turkestan.—(See Turkestan.)

West Virginia, an E. central st. U.S.A., bounded by the R. Ohio, the Alleghany Mtns., Virginia, Maryland, Kentucky, and Penn.; area 24,780 sq. m.; coal, salt, petrol; agr. and grazg.; p. 1,750,000 (rapidly increasg.). Cap. Wheeling. The Appalachian coal-field extends over nearly the whole of the State, which ranks fourth among the States in its coal output. Of its many mineral springs, the White Sulphur Springs are the most famous. Until the civil war this State was included in Virginia, but the northern and western counties, which had remained loyal to the Federal government, were constituted the State of Virginia by themselves, West Virginia, which had rebelled, being also made a State to itself.

Westward Ho, picturesque cst. *vil.* Blideford B., Devon, Eng. p. 5,864; Military colt. The name is derived from Charles Kingsley's well-known romance. There are excellent bathing opportunities, and there is a fine golf course.

Westwood, *t.* in mining dist. nr. Rockhampton, Queensland, p. 8,644. [Eng., p. 5,346.

Wetheral, *t.* on R. Eden, nr. Carlisle, Cumberl.,

Wetherby, mkt. *t.* on R. Wharfe, W.R. Yorks, Eng., p. 2,416. [Pruss. Saxony, p. 12,465.]
Wetlin, industri. *t.* on R. Saale, nr. Schwarzwald, Pruss. Saxony, p. 12,465.
Wetter, or **Wetter**, *t.* Sweden, 25 m. S.E. of L. Wener (p. 101); area 133 sq. m. part of an extensive canal system; nr. S. end is the picturesque isl. of Veling (8 m. by 5 m.) with ruined palace. Over ninety small tributaries run into it. Its waters, which are of a beautiful green, are noted for their irregular risings and fallings, and for corresponding variations in the weather.
Wetteren, *t.* in Belgium, nr. Ghent, on the R. Scheldt; textile manuf., p. 16,112.
Wetterhorn, famous *peak* of Bernese Oberland, Switzerland, alt. 12,105 ft., 10 m. S.E. of the L. of Brienz.
Wetzlar, *t.* on R. Lahn, nr. Coblenz, Rhenish Prussia; in iron-mining regn.; once an impl. t. and seat of the Supreme Court of the Empire; cathedr., ruined mediæval castle, p. 9,823. The scene of Goethe's *Sorrows of Werther* is laid in Wetzlar.
Wexford, maritime co. of prov. Leinster, S.E. Ireland; area 901 sq. m., pasture, tillage, dairy, stock-breeding, fishery, p. (falling) 10,529. There is only one hill of any particular height, and that is Mount Leinster, on the border, 2,610 ft. The Slaney is the chief river, and empties itself into sea through Wexford harbour. There are valuable fisheries. Several old castles survive, as well as the monasteries of Dunbrody, Tintern, and Ross. Cap. W. t. on R. Slaney, p. 12,455. Some of the old fortifications and part of St. Selisker's priory remain. Cromwell took the town in 1644. In the insurrection of 1798 many serious disturbances took place both in Wexford city and in other parts of the county.
Wexjö, or **Wexlô**, *t.* on L. Sodre, Kronoberg, Sweden; 13th cent. cathedr. (lately restored), royal palace and castle (ruined), p. 7,576. [Thames.]
Wey, R. Hants and Surrey, Eng.; trib. (35 m.) of R. Weymouth, *par.* of Norfolk, on the est., 13 m. E.N.E. of Walsingham. [Eng., p. 6,266.]
Weybridge, *par.* on R. Thames and Wey, Surrey.
Weymouth, industri. *t.* (boot and shoe manuf.) Norfolk co., Mass., U.S.A., p. 11,642; also pt. on St. Mary's B., co. Digby, Nova Scotia, p. 1,886.
Weymouth and Melcombe Regis, *cor.* and *wt.* pt. on Weymouth B., Dorset, Eng., p. 2,235. The two quarters of the town are separated by the Wey, which, after broadening into a tidal "Backwater," makes its way to the sea. Old Weymouth is on the S., and modern Melcombe Regis facing the bay. Bes to the N. in older times they were separate boroughs, and each returned two members to Parliament until 1821, when they were constituted one conjoint borough, returning two members between them. The two towns are connected by a bridge erected in 1881. Weymouth attained great popularity through the frequent visits of George III. Thomas Love Peacock was a native.
Whalley, *vil.* of Lancashire, on the Calder, 31 m. S. by W. of Clitheroe; has a ruined Cistercian abbey (1195). [area 71 sq. m., p. (about) 1,000.]

Whedding, *c.* on R. Ohio, cap. of W. Virginia, U.S.A.; gt. rly. and riverside comm. centre, iron and steel manuf., p. 40,128. [alt. 2,414 ft.]
Wheranda, *mt.* nr. Ingleton, W.R. Yorks, Eng.
Whickham, industri. *t.* nr. Gateshead, Durham, Eng., p. 12,332.
Whitby, *colly.* *t.* nr. Coatbridge, Lanarksh., Scotl., p. 5,025.
Whitby, *ham.*, *vil.* Isle of Wight (in wh. is situated the former marine Royal res., Osborne House, given

by King Edward VII. to the British nation on his coronation).
Whitburn, *cat. par.* nr. Sunderland, Durham, Eng., p. 2,814; also burgh on R. Almond, Linlithgowsh., Scotl., p. 2,875.
Whitby, *cat.* and *wt.* pt. facing the German Ocean, at mth. of R. Esk, N.R. Yorks, Eng.; fisheries, jet manuf., shipbuilding, famous abbey, p. 12,132. The two sides of the town stand on either side of the harbour, with a stone bridge, with a swivel, connecting them. The older portions of the town are on the east side, and comprise a number of steep, narrow streets, rising to the heights above, on which stands the old parish church of St. Mary, and the ruins of St. Hilda's Abbey, the latter founded in the 7th century, and after being destroyed by the Danes in 867 was refounded in 1078 as a Benedictine Abbey for monks. The church is of Norman origin, and is approached from the town by a stone stairway of nearly 200 steps. Captain Cook was a native.
Whitby (formerly Windor), *t.* on L. Outarico, Can., p. 3,814.
Whitchurch, mkt. *t.* nr. Basingstoke, Hants, Eng.; p. 1,935; also mkt. *t.* nr. Shrewsbury, Salop, Eng., p. 5,771; also *vil.* on R. Taf, Glamorgansh., Wales, nr. Llandaff.
White, R. Arkansas, U.S.A., trib. (350 m.) of R. Mississippi; also R. Indiana, U.S.A., trib. (350 m.) of R. Wabash. [R. Tweed.]
Whiteadder, R. Berwicksh., Scotl.; trib. (34 m.) of Whitechapel, *E. dist.* of London, Eng.; industri., mostly in the Tower Hamlets; p. 34,118. [3,814.]
White Creek, *wt.* nr. Troy, New York, U.S.A.; p. 11,642.
Whitefield, *t.* nr. Tewkesbury, Gloucestersh., Eng.; industri., p. 6,967.
Whitehall, *t.* at head of L. Champlain, Washington co., New York, U.S.A.; p. 5,240; timber tr.
Whitehaven, *t.* in Egremont div., Cumberland, Eng.; iron-ore smelting, coast tr.; p. 19,048. The prosperity of Whitehaven has resulted from the possession of valuable local deposits of coal and iron-ore, which have provided the means for the successful carrying on of many industries, including ironworks, iron-shipbuilding, collieries, iron-mines, etc. The harbour has a wet-dock of 5 acres. Paul Jones attacked Whitehaven in 1778.
White Horse, the name given to the figure of a horse cut out on a hillside by removing the turf from the surface. Several of these exist in various parts of the country, the largest being at Uffington, Berkshire. It measures 355 feet in length, and can be seen for many miles. There are other white horses at Stratton Hill, Westbury (p. 101), Cherhill, Marlborough, and Pewsey.
Whitekirk, *par.* on the Haddingtonshire est., possessing a church once a great resort of pilgrims, 41 m. S.E. of North Berwick.
White Mtns., part of the Appalachian system, New Hampshire, U.S.A.; highest summit, Mt. Washington, 5,805 ft.
White Plains, *t.* Westchester co., New York, U.S.A.; residential; here in 1775 Genl. Howe defeated the American forces; p. 7,754.
White R., rises in Arkansas and flows through that state and Missouri to the Mississippi near the mouth of the Arkansas; has a course of 800 m., 300 of which are navigable.
White Sea, or G. of Archangel, *inlet* of the Arctic Oc., N. Russia, area 47,346 sq. m. It is frozen over from early September to late May, and has direct communication with the Dnieper, the Volga, and the Black and Caspian Seas.
White Sulphur Springs, a *wt.* pt. of West Virginia.
Whitewater, *vil.* Wisconsin, U.S.A., nr. Milwaukee; p. 4,816.
Whithorn, *royal burgh* Wigtonsh., Scotl., p. 1,080; 21 m. N.W. of the Isle of Whithorn, and 21 m. S. of Wigtown. St. Ninian founded a church here in 397, and was buried here in 432. At one time it was the seat of a bishopric, the see of Galloway, an old priory being made the cathedral, which was much resorted to by pilgrims.
Whitkirk, *wt.* nr. Leeds, W.R. Yorks, Eng.; industri.; p. 3,419.

Whitley, *cat. vil.* on Whitley B., nr. North Shields, Northumberland, Eng.; p. 378.

Whitstable, *spa.* and *cat. rest.* nr. Canterbury, Kent, Eng.; famous for its oysters; p. (of par., includg. *Sessalier*), p. 584.

Whittingham, *par.* in Haddingtonshire, 3 m. S.E. of East Linton; includes the seat of the Rt. Hon. *x.*

Whittingham, or Whittington Moor, *colly. townsip.*, nr. Chesterfield, Derbysh., Eng.; p. 272.

Whitlessy, or Whitlessy, *mkt.* t. Cambridgesh., Eng.; p. 424.

Whitwick, *industri.* t. nr. Loughborough, Leicestersh., Eng.; p. 548.

Whitwood, t. (*mfg.*) nr. Pontefract, W.R. Yorks, Eng.; p. 548.

Whitworth, *industri.* t. nr. Rochdale, S. Lancash., Eng.; p. 872.

Whydah, *cat.* t. Dahomey, on lagoons nr. W. cat. Africa; under French ind.; p. 15,000.

Wichita, R. Texas, U.S.A.; flows 225 m. to the Red R., Clay co.; also t. in the Arkansas valley, Kansas, U.S.A.; meat-packing centre in agr. and stock-raising regn.; p. 29,450.

Wick, *spa.* and *burgh*, Caithness, Scotl.; herring fisheries centre, one of the Wick parly. burghs, p. 986. The royal burgh, with its pleasant suburbs of Lousburgh and Pultneytown, stands on the south bank of the Wick River. [8,866]

Wickham, *sub.* of Newcastle, N.S.W.; *industri.* p. 284.

Wickham Market, t. on R. Deben, Suffolk, Eng., p. 284.

Wicklow, *maritime co.*, Leinster prov., Ireld., on E. cat. S. of Dublin; area 781 sq. m., pastoral and agr., p. 60,003 (decreasg.) princ. peasantry; the Wicklow mountains attain their highest point in Lugnaquilla (3,099 feet), and their slopes reveal many beautiful glens, including Glendalough, Glendalure, Inail, the Glen of the Downs, and Avoca. Beside the Liffey and the Slaney, both of which rise in Wicklow, there are numerous picturesque mountain streams, and several beautiful lakes, though small; chf. t.'s W. (cap.) Bray, and Arklow (*q.v.*). (Sudbury, p. 963)

Wickwar, t. in Gloucestershire, 4 m. N. of Chipping-Widdin, fort. t. on R. Danube, Bulgaria; ruined mosque and palace, p. 15,118.

Widnes, t. on R. Mersey, Lancs, Eng.; *manuf.*, p. 29,455. Was incorporated in 1902, and has industries of iron, copper, soda, candles, soap, manures, etc. 13 m. E.S.E. of Liverpool.

Wied, *km.* R. Gerny, joins R. Rhine at Newuld; also name of former countship of German Emp. situate in this dist.

Wieliczka, salt-mining t. nr. Cracow, Austr. Galicia; celebrated subterranean chapels, with altars and ornamentatn. in rock salt, p. 6,015. [6,448]

Wielun, t. nr. Kalisz, Russn. Poland; *industri.*, p. Wiesner Neustadt, Lower Austria.—[See Neustadt.]

Wieringen, *str.* and t. in Zuyder Zee, N. Holland, p. 289.

Wiesbaden, t. and pop. *wat. pl.* on S. slope of the Taunus, Hesse-Nassau, Pruss.; minl. baths (via. by 120,000 persons annually), many fine bldgs., p. 170,000. Known in Roman times, it later obtained ill-repute as a gambling place, but is now a prosperous health resort. It has many hot springs, the principal one being the Bolling Spring, 130° F. The chief buildings are the palace (1840), the Kursal (1810), town-hall (1888), and a Greek chapel (1829) built by the Duke of Nassau as a mausoleum for his wife.

Wieselburg, t. on brch. of R. Danube, nr. Pressburg, Hungary, p. 5,216.

Wigan, t. S.W. Lancs. Eng.; cotton and iron mfg. centre in colly. dist., p. 89,171. Standing in the centre of a great coalfield, it has been able to play a considerable part in the development of the Lancashire industries, and has iron foundries and railway-wagon works, cotton factories, paper mills, etc., besides doing a large trade in coal. The Royalist Earl of Derby occupied the town in 1646 but it was twice taken by the Parliamentarians, and in 1659 Lord Derby was defeated by Lilburne. Leland the antiquary was a native of Wigan.

Wight, Isle of, Eng. Chan., included in co. Hants;

area 146 sq. m., undulating and agr. with numerous wat. places all round the isl.; the Romans had stations at Carisbrooke and Brading. It came under Saxon rule in the seventh century, and after the Norman Conquest was granted first to the Fitzosbornes and later to the Redvers family, who held it until it passed into the hands of the Crown in 1264. Prior to 1832 the island returned six Members of Parliament, two each for Newport, Yarmouth, and Newtown; now it only returns one Member for the whole island. Newport (*q.v.*) is the ch. t., Cowes (*q.v.*) princ. port, p. 88,193.

Wigton, *mkt.* t. of Cumberland, with *manuf.* of woollens, 12½ m. S.W. of Carlisle, p. 3,689.

Wigtown (or West Galloway), *maritime co.* on Irish Sea, S.W. Scotl.; area 485 sq. m.; oats, wheat, agr., dairying, p. 37,990 (decreasg.) Cap. W., on W. Bay; fishery, p. 1,268.

Wi-ju, a t. of Korea, near the Chinese frontier to the south of the estuary of the Yalu; p. 3.

Wildbad, a t. of Württemberg, in the Black Forest on the Euz, 33 m. S.E. of Carlsruhe, and famed for its salt baths; p. 3,500, over 7,000 visitors annually.

Wilcania, *township*, on Darling R., N.S.W., in pastoral dist., p. 2,140.

Wilderness, swampy *regn.* N.E. Virginia, U.S.A., S. of Cape of Fear but indecisive fighting American Civil War, 1864.

Wilhelmshaven, *naval str.* of the Germ. Emp., fort in Jähde terr. on the N. S. nr. Bremen; also sea bathg. rest., p. 25,560. Inaugurated by King William I. in 1869, it has since been developed and defended until it forms a fortress of the first order, with forts, moles, dry-docks, and stores of vast extent.

Wilkesbarre, t. on R. Susquehanna, Luzerne co., Penn., U.S.A.; in anthracite coal, regn., p. 67,105.

Wilkinsburg, *par.* Allegheny co., Penn., U.S.A., subm. to Pittsburgh, p. 12,224.

Willemsstad, *cap.* Curaçoa, Dutch W. Indies, p. 10,824.

Willenhall, *infig.* t. Staffs, Eng., nr. Wolverhampton, p. 18,858. [industri., p. 154,267]

Willenden, N.W. *sub.* London, Eng.; residential, and Williamette, R. Oregon, U.S.A., trnb. (300 m.) of Columbia R.

Williamsburg, t. (collegiate) of James City co., Virginia, U.S.A.; famous st. cap. battle 1862, p. 2,214; also vil. Hampsh. co., Mass., U.S.A., p. 4,124. The William and Mary College (1693) is here.

Williamsport, t. on Susquehanna R., Lycoming co., Penn., U.S.A., riv. centre, timber tr.; p. 31,860, 70 m. N. of Harrisburg.

Williamstown, *port* nr. Melbourne, Victoria; shipbldg., p. 14,516; also vil. nr. Greenville, S. Carolina, U.S.A.; p. 3,120.

Willmantic, t. on R. W., Windham co., Connecticut, U.S.A.; thread and textile factories; p. 2,215.

Willington, *township*, in colly. dist. co. Durham, Eng.; nr. Bishop Auckland; p. 7,734.

Willington Quay, t. on R. Tyne, Northumbld., Eng.; nr. North Shields; p. 9,116; *industri.*

Williton, a t. of Somerset, 24 m. N.W. of Taunton; p. 1,204.

Willoughby, *sub.* of Sydney, N.S. Wales, 5 m. N. of the city; contains numerous factories and market gardens.

Willunga, *township*, nr. Adelaide, S. Australia, p. 1,443.

Wilmington, t. on Delaware R., Delaware co., Delmar, U.S.A.; shipbldg., iron foundries, machine-factories, p. 87,120; also c. on Cape Fear R., Hanover co., N. Carolina, U.S.A.; was chief Confederate port during the civil war; gt. tr. in cotton, timber, and naval stores; p. 25,554.

Wilmalaw, *industri.* t. on R. Bollen, nr. Stockport, Cheshire, Eng.; p. 8,153.

Willadea, t. nr. Bradford, W.R. Yorks, Eng.; p. 2,958.

Wilson's Promontory, S-most *headland* of Victoria, projectg. into Bass Strait.

Wilton, old *mkt.* t. Wilts, Eng., nr. Salisbury; carpet mfg., p. 2,124. Former capital of Wessex and the seat of a bishopric until 1093; it was at Wilton House here, the mansion of the Earls of Pembroke, that Sir Philip Sidney wrote a portion of his Arcadia.

Wiltshire, S.W. inland co., Eng., N. of Hants and

Dorset; area 1,354 sq. m.; agr. and pastoral; p. 266,876. It is chiefly an agricultural county, and the Calne district is famous for its Wiltshire bacon. At Bradford and at Trowbridge the manufacture of broadcloth and carpets have long been carried on. Wiltshire was occupied by the Romans, and the defeat of the British in 525 at Old Sarum by the Saxons was the first important victory of the latter. Cap. Salisbury.

Wimbledon, *t.* and residt. dist. Surrey, Eng., a S.W. sub. of London, with famous common; p. 54,876.

Wimborne, or Wimborne Minster, mkt. *t.* nr. Poole, Dorset, Eng.; p. 3,711. A nunnery was founded here about 705, which Edward the Confessor converted into the minster, with its fine central and west towers, and containing the tomb of Ethelred I.

Wimmeria, N.W. dist. Victoria, Australia; area 25,000 sq. m.; pastoral.

Wimpfen, *t.* nr. Heilbronn, Hesse, Gerny., on R. Neckar; battle 1622; p. 2,842. [Africa; p. 3,216.

Winburg, *t.* on Oet R., Orange River Col., Brit. S. Wincanton, mkt. *t.* nr. Glastonbury, Somerset, Eng.; p. 2,693. [p. 2,946.

Winchcomb, mkt. *t.* nr. Cheltenham, Gloucester, Eng.; Winchelsea, *t.* nr. Hastings, Sussex, Eng.; formerly an import, walled spk; p. 1,714. Old Winchelsea stood 3 to 4 to the sea. Edward III. built New Winchelsea, three of the gateways of which, and parts of a Franciscan monastery, still remain. [p. 842.

Winchendon, *vill.* nr. Worcester, Mass., U.S.A.; p. Winchester, *c.* on R. Itchen, Hants, Eng.; anc. cap. of the Saxons; fine cathed., college, barracks; formerly famous for woollen manuf.; Winchester College was founded by William of Wykeham, in the 14th century, much of the original edifice still remaining. The hall is 53 ft. long. The hospital of St. Cross, a mile distant from the city, was founded by Des Bails in 1132, but rebuilt later by Cardinal Beaufort; p. 23,360. From the 8th to the 13th century Winchester almost rivalled London in civic importance. King Alfred was educated here and resided here, founding the "New Monastery," later called St. Grimbald's. William the Conqueror had a palace at Winchester. In the monastery rebuilt in the 12th century, and here, in 1867, were discovered the bones of five persons, supposed to be those of King Alfred, his queen, two sons, and St. Oswald. Henry III. was born in the castle. Cromwell took the castle and city in 1645. The large hall, 110 ft. long, and one of the towers of the castle are all that remain of the castle. Here Charles II. had a red brick palace (now a barrack). The cathedral contains the tombs of Rufus, Cardinal Beaufort, Wykeham, Waynflete, Gardiner, Izaak Walton, Jane Austen, and many others of note.

Winchester, *t.* on Mad R., Litchfield co., Connecticut, U.S.A.; cutlery manuf.; p. 8,500. Also *t.* in Blue Grass; agr. and stock-raising region, Kentucky, U.S.A.; p. 6,757. Also *t.* in Middlesex co., Mass., U.S.A., sub. to Boston, p. 8,514. Also *c.* in the Shenandoah valley, Virginia, U.S.A.; Sheridan's victory over the Confederates, 1862; p. 5,200.

Windau, Russian *vill.* in Courland, 120 m. N.E. of Memel, p. 8,000.

Windermere, largest Eng. L. (104 m. long, 1 m. wide), in Westmorland and Lancs. outlet to Morecambe Bay; also smt. *t.* on E. shore of L., p. 5,147.

Windham, *vill.* nr. Norwich, W. co., Connecticut, U.S.A.; p. 8,914; industr. [p. 7,495.

Windhill, mkt. *vill.* Bradford, W.R. Yorks, Eng.

Wind River Mtns., Wyoming, U.S.A. 8th range of the Rockies; highest pt. Fremont's Peak, alt. 13,576 ft.

Windrush, *R.* Gloucestersh. and Oxfordsh., Eng., trib. (30 m.) of R. Thames.

Windsor, *bor.* of Berks., Eng., on R. Thames; famous royal castle (founded by William the Conqueror) and park, St. George's Chapel, and the 'Royal Mausoleum'; p. 15,370. Edward III. and Henry VI. were born in Windsor Castle, and George III., George IV., and William IV. died there. Among the monarchs buried there are Henry VI., Edward IV., Henry VIII., and Charles I. It was here that Edward III. established the order of the

Garter. There are extensive cavalry and infantry barracks in the town; Cumberland Lodge, Frogmore, and Windsor Forest are near, and Old Windsor is an adjoining par.; while Eton (p. 21), across the R. in Bucks, is included in the par. limits.

Windsor, *c.* and *port.* on the Detroit R., Ontario, Canada; opp. Detroit *c.*; bicycle and machinery works; p. 15,715. Also *t.* on Connecticut R., Hartford co., Conn., U.S.A.; industr.; p. 3,917. Also *spt.* on Minas Par., Nova Scotia (contains King's College), p. 3,695. Also *bor.* on Hawkesbury R., nr. Sydney, N.S.W., p. 2,854.

Windward Isle, Crown col., Ct. Brit., in the West Indies, comprising S.E. portion Lesser Antilles (St. Vincent, Grenada, Grenadines, Tobago, and St. Lucia; all of which see separately); total area 664 sq. m.

Windward Passage, channel (60 m. wide) between Windward, *par.* in Yorks, 124 m. E.S.E. of Hull. The birthplace of Andrew Marvell.

Winfield, *c.* on R. Walnut, Cowley co., Kansas, U.S.A.; collegiate and commercial centre in agr. dist.; p. 6,014. [industr.; p. 6,558.

Wingate, township Durham, Eng., nr. Hartlepool; Wingfield, *par.* in Suffolk, near Harleston. There is an ancient castle here built by the De la Poles.

Wingfield, South, *par.* in Derbyshire, near Alfreton. It was at Wingfield Manor House where Mary Queen of Scots was imprisoned.

Wingham, *t.* in farming dist., N. of Sydney, N.S.W., (p. dist.) 7,042.

Winnebago, L. nr. Milwaukee, Wisconsin, U.S.A., 27 m. long, outlet by Fox R. into Green Bay.

Winnipeg (formerly Fort Garry), *cap.* of the province of Manitoba, Can., at jctn. of Red and Assiniboine Rs.; the principal commercial centre of the Canadian N.W.; p. 120,000, immense wheat export. Incorporated in 1873. Is a substantially built, modern town, with wide streets, tramways, electric light, etc. It has the university of Manitoba, Government offices, city hall, and huge grain-elevators and flour-mills.

Winnipeg, L. Canada, 40 m. N. of Winnipeg *c.*, 260 m. long, 25 m. to 60 m. wide; contains several large isls. (Reindeer, 70 sq. m., Big Isl., 60 sq. m.); receives the waters of the Winnipeg R. (flows 200 m. from the L. of the Woods), the Red R., and the Saskatchewan R.; discharges by the Nelson R. to Hudson Bay.

Winnipegosis, L. of Manitoba and Saskatchewan, Canada; area (exclusive of isls.) 2,000 sq. m.; 50 m. W. of L. Winnipeg, into which it empties.

Winnipisagoes, L. nr. Concord, New Hampshire, U.S.A.; noted for its beautiful scenery; 24 m. long; empties by the W. R. into the Merrimac.

Winona, *c.* on the Mississippi R., Minnesota, U.S.A.; *vill.* centre, tr. in corn and timber; p. 20,494.

Winoski, or Onion R., Vermont, U.S.A., flows (90 m.) to Champlain; also Winoski Falls, *vill.* of Chittenden co., Vermont, on R., p. 2,648.

Winschoten, industr. *t.* nr. Groningen, Holland, p. 7,864. [Eng.; salt wks.; p. 10,772.

Winsford, *t.* on R. Weaver, nr. Northwich, Chesh.

Winslow, mkt. *t.* of Bucks, 51 m. S.E. of Buckingham; p. 1,800.

Winster, *vill.* of Derbyshire, 4 m. W. by N. or Matlock; p. 800.

Winston, mkt. *t.* nr. Salem, N. Carolina, U.S.A.; tobacco and cotton factories; p. 11,416. Also *vill.* on R. Tees, Durham, Eng., nr. Barnard Castle.

Winterbergen, *min. range* Cape Col., Brit. S. Africa; highest summit, 7,865 ft.

Winterhoek Mtns., *range* nr. Port Elizabeth, Brit. S. Africa; highest pt., 4,000 ft. (Madison co.), p. 4,622.

Winteret, *t.* nr. Des Moines, Iowa, U.S.A., cap.

Winterlow, *par.* in Wilts, 6 m. E.N.E. of Salisbury, and associated with memories of Hazlitt.

Winterow R., *t.* nr. Arnheim, Gelderland, Holland; industr.; p. 8,846.

Winterthur, *t.* on R. Eulach, cant. Zurich, Switz.; formerly a free imperial *c.*, industr. and comm.; p. 25,000. [Humber; p. 1,486.

Winterton, mkt. *t.* Lincolnsh., Eng., nr. Barton-on-Wippen, R. Pruss. Saxony, trib. (50 m.) of R. Un-

- strut; also another R., Prussn. Saxony, trib. (40 m.) of R. Saale; also R., Westphalia, flows (50 m.) to R. Rhine, nr. Cologne. [Industri., p. 6,242.]
- Wipperfurth, *t.* Rhinisch Prussia, 23 m. N.E. Cologne; *Wirksworth*, *t.* in Derbysh., Eng.; lead mining; p. 6,252.
- Wirral, industri. *dist.* W. Cheshire, Eng., between Wirbach, or Wirbeach, *t.* on R. Nene, Isle of Ely, Cambridgesh., Eng.; exports coal; p. 10,282. The parish church is interesting and has a fine tower. A castle, founded by the Conqueror in 1071, rebuilt by Bishop Morton in 1483, restored by Bishop Andrewes, again rebuilt by Cromwell's secretary, Thurloe, from designs by Inigo Jones, was kept up until 1816, when it was finally demolished. Many Catholic recusants suffered imprisonment in the castle under Elizabeth.
- Wisby, old *port*, Gotthland isl., W. cost. Sweden; cashed. Many antiquities of the Stone, Bronze, and Iron Ages; p. 8,500. During the 10th and 11th centuries it was one of the leading commercial cities of Europe, and a principal centre for the operation of the Hanseatic League. Its prosperity was lost, however, in 1561, when Valdemar III., of Denmark, took possession of it. The ancient walls and towers are still standing.
- Wisconsin, R. intersecting st. same name, U.S.A.; trib. (500 m.) of Mississippi; also N. cent. U.S.A., adjng. L. Superior and L. Michigan; area 56,040 sq. m., agr. land and rolling prairie, dock-kpg., corn-growing, timber tr., and mining; admitted as a State in 1848; p. 2,350,000. Wisconsin contains some 2,000 small lakes, the largest of which is Winnebago, 28 m. long and 10 m. broad. Nearly half a million people are engaged in agriculture in the State. It has twice suffered from devastating forest fires—in 1871 and 1894—over 1,000 lives being lost in the 1871 fire. From 1793 to 1815 Wisconsin was under British control; was forced into a U.S. territory in 1825 and extended to the Dakotas, but the Mississippi was made its Western boundary in 1836; was admitted a State in 1848. Cap. Madison (p. v.).
- Wiahaw, *burgh* Lanarksh., Scotl., nr. Glasgow; railway works, engineering and other factories; p. 25,263.
- Wimke, R. N.R. Yorks, Eng., trib. (24 m.) of K. Swale.
- Wismar, *fortd.* *port*, on the Baltic, Mecklenburg-Schwerin, Germany; the Fürstentum, a former ducal residence, dates from the 14th century; and four gates of the old town remain: good trade; p. 21,816.
- Wissembourg, *t.* mfg. *t.* in Lower Alsace, 42 m. N.N.E. of Strassburg; previous to 1871 a French fortified town near the frontier of the Bavarian palatinate. At this spot, on the 4th Aug., 1870, occurred the great battle between the French and German armies, resulting in the first important victory of the latter.
- Witham, R. Rutland and Lincs., Eng., flows (80 m.) to the Wash; also *t.* nr. Chelmsford, Essex, Eng.; agr. centre; p. 3,549.
- Wihlmann, coast bathing *resort*, E.R. Yorks, Eng., nr. Patrington, *port*, (resid. *dist.*), p. 2,792.
- Witlington, industri. *t.* S.E. Lancs., Eng., within parly. limits of Manchester; p. 38,614.
- Witkowitz, mining *t.* in dist. Mährisch-Osttau, Moravia, p. (mainly German) 24,125.
- Witley Bay, fishing *settlement*, Newfoundland, nr. St. John's, p. 1,214.
- Witney, mkt. *t.* in Woodstock div., Oxfordsh., Eng., blanket and glove factories; Witney blankets have long been famed; p. 3,592.
- Wittenburg, *t.* on R. Ruhr, Westphalia, nr. Arnsberg; iron, glass, and machinery *manuf.*; p. 28,555.
- Wittenberg, *fortd.* *t.* on R. Elbe, Prussn. Saxony; castle-church, textile factories, flower cultivation; p. 20,324. Luther, Melancthon, Frederick the Wise, and John the Steadfast lie buried in the Schloss-Kirche, which was restored and reopened in 1892.
- Wittenberge, *t.* in Potsdam Govt., prov. Brandenburg, Pruss.; fine bridge over K. Elbe; woollen cloth *manuf.*; p. 18,018.
- Wittingham, *t.* on Goldbach R., S. Bohemia, Austria; artificial fish ponds, beer brewing, etc.; p. 5,570.

Woodstock, *t.* on Thames R., Oxford co., Ontario, Can., 30 m. N.E. of London; exports dairy prod.; *p.* 9,018; also port on R. St. John, New Brunswick; *p.* 1,864; also the nr. Hartford, Connecticut, U.S.A.; *p.* 3,175; also *t.* on the Ottaquechee R., Vermont, U.S.A.; *p.* 2,918.

Woodville, *t.* in co. Waipawa, New Zealand; *p.* 1,814; also *t.* nr. Adelaide, S. Australia; *p.* (dist.) 3,263.

Wooldale, *townshp.* Kirkburton par., W.R. Yorks, Eng.; industri. *p.* 4,886. [hills; *p.* 1,640.]

Wooler, mkt. *t.* Northumberland, Eng., nr. the Cheviot Woolmer Forest, a large tract of wooded country on the borders of Hants and Sussex.

Woolsthorpe, *hamlet* of Lancashire, 8 m. S. of Grantham; noted as the birthplace of Sir Isaac Newton. [Lancs, Eng.]

Woolton, or Much Woolton (*p.v.*), nr. Liverpool, Woolwich, *bor.* garrison, and dockyd., *t.* on R. Thames, Kent, Eng.; 10 m. from London; princpl. artillery arsenal of Britain, dating from 1585, when Queen Elizabeth filled the Tower House, a mansion in Woolwich Warren, adjoining Plumstead Marshes, with arms and armour. In 1716 the proof of ordnance was given to Woolwich, and guns began to be cast there. With the beginning of the 19th century great extensions were made, and the works now cover some hundreds of acres. There was a royal dockyard at Woolwich until 1869; it is now used as a military store depot; *p.* 121,403. North Woolwich (*p.* 5,984) on opp. side of Thames (formerly included in Essex) now forms part of the co. of London.

Woonsocket, *c.* on R. Blackstone, Providence co., Rhode Isl., U.S.A.; textile manuf.; *p.* 38,118.

Wooster, *c.* Wayne co., Ohio, U.S.A.; in agr. dist.; university; *p.* 6,214. [W., 444.]

Wootton Bassett, *t.* nr. Swindon, Wilts, Eng.; *p.* 1,444.

Worcester, middl. co. Eng., W. of Warwicksh.; area 751 sq. m.; agr., pasturage, hops, orchards, minls., manuf.; *p.* 526,143. Cap. W., on c. of R. Severn; cathedr., porcelain wks., iron foundries; large trade in hops, fruit, etc. In 1679 became the seat of a Mercian bishopric. The cathedral is in the form of a double cross, 420 ft. long, 126 ft. wide across the west transept, and 60 to 67 ft. high, with a central tower of 190 ft. Has been many times rebuilt, the latest restoration being completed in 1887, at a cost of £100,000. It has columns of Purbeck marble. Among the bishops of Worcester may be mentioned St. Dunstan, Latimer, Whitgift, Stillingfleet, and Perowne; *p.* 47,687.

Worcester, *c.* in W. co., Mass., U.S.A., 44 m. S.W. of Boston; boot manuf., tool-making, etc.; *p.* 145,500; also *t.* in wine-grow. dist., Cape Col., Brit. S. Afr.; *p.* 7,245. It is called "The Academic City," and contains the State Normal School. From the porch of the Old South Church the Declaration of Independence was first read in Massachusetts.

Workington, mkt., and *pt.* at mth. R. Derwent, Cumberland, Eng.; ironwks., cycle and motor-car factories. The prosperity of the *t.* is chiefly owing to its coal mines. There are important salmon

fisheries. Workington Hall, the seat of the Curwens, dates from the eleventh century. It was there that Mary Queen of Scots was entertained on her flight from Langside, on the 16th May, 1568; W. was incorporated as a municipal borough in 1888; *p.* 25,009.

Workshop, mkt. *t.* Notts, Eng.; chair-mkgr., box and case manuf.; *p.* 20,387. It borders upon the northern extremity of Sherwood Forest. At Workshop Manor (burned down in 1762) Mary Queen of Scots was imprisoned under the guardianship of the Earl of Shrewsbury. Workshop church, originally an Augustinian priory of the 12th century, is a notable edifice.

Worlitz, *t.* in Anhalt, Gerny., nr. Magdeburg; ducal palace and park; *p.* 4,885.

Worms, *c.* nr. the Rhine, Hesse-Darmstadt, Gerny.; famous Romanesque cathedr.; famous in former times as a royal res. and seat of Diets (at one of which—in 1521—Luther made his memorable defence). The scene of the Nibelungenlied is laid in Worms; Charlemagne frequently resided here. The industry of the town was so great in the middle ages that it had a population of 60,000. Centre of wine industry; gd. modn. tr.; *p.* 51,800.

Worms Head, *promont.* on Glamorgansh. cst., S. Wales.

Wormwood Scrubs, a London dist. 3 m. N. of the Marble Arch. Its features are a common, a prison, and a railway station.

Worsborough, industri. *t.* in colly. dist. nr. Barnsley; W.R. Yorks, Eng.; *p.* 12,794.

Yonkers, *c.* Westchester co., New York, U.S.A., on R. Hudson; textile and iron manuf., p. 80,000.

Yonne, *dep.* Cent. France; area 2,804 sq. m. watered by R. Y. (127 m. long), agr. and wine-growing (Burgundy), liv. also much min. wealth p. (declined) 316,000. Cap. Auxerre.

York, largest *co.* in Eng., N. of Humber and S. of Durham, E. of Lancashire and washed by the N. Sea; area 6,067 sq. m., divided in three Ridings (W., largely mfg. and mining; N. agr., past., and mining; E. past. agr., with cst. industries), as well as 4,405,445 (3,000,000 of whom are domiciled in the mfg. dists. of the W.R.). Cap. York, c. on the R. Ouse; magnificent cathed., old walls and castle, c. gateways and many fine churches; gd. tr. and mfts. for cattle and corn, p. 82,297. York is the seat of an archbishopric. It was known as Eboracum in Roman times. The Minster, one of the finest and most celebrated of English cathedrals, occupies the site of a church erected in the 7th century by Edwin, the first Christian King of Northumbria, which was destroyed by fire in 747. It was rebuilt, but was once more destroyed during the Norman invasion, except the central wall of the existing crypt, which also includes portions of the church erected by Archbishop Rodger (1154-81). Archbishop Gray added the fine Early English transept in the 13th century, and the present nave was built between 1291 and 1345, the Decorated chapter-house between 1300 and 1330, and the Perpendicular choir between 1373 and 1400. The two western towers, as well as the central lantern tower, belong to the 15th century. An incendiary fire, in 1829, the work of Jonathan Martin, an insane fanatic, and another fire of 1840, did great damage to the Minster, but ample restorations were made in later years. The Benedictine abbey of

St. Mary, founded by Rufus, and now in ruins, was once of great wealth and distinction. The York Guildhall dates from the 15th century. Hull is the chief port, Sheffield and Leeds the largest towns.

York, c. Nebraska, U.S.A., cap. Y. co., rlvly. centre, p. 6,046; also bor. on Codorus Creek, Penn., U.S.A.; manufl.; p. 44,750; also vill. in Y. co., Maine, U.S.A.; p. 4,428; also t. nr. Perth, W. Australia; p. 1,212.

York, Cape, promontory, on York Peninsula, N. extremity of Queensland; also a C. of Hayes Peninsula, Greenland.

York Peninsula (100 m. long, 30 m. wide), S. Australia; betwn. Spencer and St. Vincent Gulfs.

York Factory, t. at mth. of Nelson R. on Hudson R., Keewatin dist., Canada, p. 1,246.

York Isls., grp. in Torres Strait, S.E. of New Guinea, and N. of C. York.

York, N., a tidal estuary of Chesapeake B., U.S.A., formed by the meeting, at West Point, of the Virginia Rrs. Pamunkey and Mattaponi.

PEARS'
DICTIONARY
of EVENTS.

Pears' Dictionary of Events

SETTING FORTH IN CHRONOLOGICAL ORDER THE LEADING EVENTS
IN THE HISTORY OF THE WORLD.

In the record of the years here set down, it has only been possible to mention in the briefest manner the principal events in the world's history, with the dates of their occurrence. The story is naturally fullest in relation to our own country, but few of the more important facts in the history of other countries have been passed over; and in this issue a special feature is made of a Chronicle of the War, the record being brought up to the date of going to press.

B.C.
2234 Chaldean astronomical observations begun.
2200 Hua dynasty founded in China.
1773 Assyrian empire founded.
1300 Period of Trojan war.

4. Gt. Brit. sends ultimatum to Germany demanding that Belgian neutrality shall be respected. Germans attack Liège. Gt. Brit. declares war against Germany. Home and Philipville in Algeria bombarded by Goeben.

5. 80,000 Germans attack Liège and are repulsed. German mine-layer *Königer Luise* sunk by H.M.S. *Amphion*. Lord Kitchener appointed Sec. for War. Parliament votes £100,000,000. Goeben and Breslau chased to Messina.

7. Germans repulsed at Liège after 3 days' and nights' fighting. Gen. Leman (defender of Liège) taken prisoner. H.M.S. *Amphion* sunk by mine. Goeben and Breslau escape from Messina.

8. British forces seize the port of Lome in German Togoland, on W. coast of Africa.

9. French occupy Mulhausen. German submarine U 15 sunk by Brit. cruiser *Birmingham*.

10. Germans enter Liège. Austrians enter Alsace.

12. Gt. Brit. declares war on Austria. Goeben and Breslau sold to Turkey.

13. Japan sends ultimatum to Germany demanding evacuation of Kiaochow. Russia issues proclamation promising autonomy to the ancient kingdom of Poland.

16. First British Expeditionary Force lands in France.

17. D. of Gen. Grierson. Belgian seat of Govt. removed to Antwerp. Austrian cruiser *Aspern* sunk by French fleet in the Adriatic.

18. Servians beat Austrians at Shabatz. Germans occupy Triermon.

19. Germans defeated by Russians near Eydtukumen.

21. Germans enter Brussels, and impose fine of £8,000,000. Gt. Brit. lends £10,000,000 to Belgium. France does the same.

22. Germans attack Namur.

23. Japan declares war on Germany. British forces engaged at Mons with Germans and hold the place two days and a night.

24. Germans capture Namur.

25. Austria declares war upon Japan. Germans destroy Louvain. Allies fall back towards Cambrai.

26. Togoland taken by the Allies.

27. Ostend occupied by Brit. marines. Kaiser *Wilhelm der Grosse* sunk by H.M.S. *Highflyer* off Rio de Oro. German cruiser *Magdeburg* sunk by Russians in Gulf of Finland.

28. Two German destroyers and two German cruisers sunk and a third cruiser disabled in the Heligoland Fight by a Brit. battle squadron.

29. German Samoa surrendered to a New Zealand force. Name of St. Petersburg altered to Petrograd.

30. La Fère taken by the Germans.

31. Allies evacuate Compiègne. Russians rout four Austrian Army Corps near Lemberg. Russians suffer reverse in East Prussia.

Sept. 1. Germans take Amiens. British losses to date 15,000.

2. Great defeat of Austrians at Lemberg after seven days' fighting.

1914, Sept.

3. Dinant sacked. French Govt. leave Paris for Bordeaux.

4. Dykes flooded around Antwerp. Russians capture Lemberg. German right ceases to move against Paris, turning east and south-east so as to strike in between Paris and the British forces.

5. H.M.S. *Pathfinder* blown up by German submarine, 291 lives lost. German attack diverted from Paris. Gt. Brit., France and Russia agree not to treat for peace separately. Germans take Rheims.

6. Germans cross the Marne at La Ferté-sous-Jouarre.

7. Allies begin to drive the Germans back from the North-east of Paris. *Oceanic* struck a rock and sank off Scotland.

8. Brit. army crosses the Marne and Germans retreat about 25 miles. Rulers of Indian native States (nearly 700) offer services in aid of Brit. arms.

10. German army still in rapid retreat; driven across the Marne with great loss. Servians capture Semlin. Gen. Botha dispatches forces against German S.W. Africa.

11. German headquarters in New Guinea captured by Australian expedition. Louvain retaken by Belgians.

12. Vtry abandoned by Germans after being fortified. Allies in pursuit. 6,000 prisoners and 100 guns capt'd by Allies in last four days. Hamburg-America war-liner *Spreewald* captured in North Atlantic waters.

13. Allies' victory continues, Germans everywhere in retreat, 62 miles gained in six days. German cruiser *Hela* sunk by torpedo from Brit. submarine E. 9. Russians win great 17 days' battle in East Prussia, capturing 30,000 Austrian prisoners.

14. 21st day of the war. German retreating forces driven across the Aisne. Brit. auxiliary cruiser *Carmania* sinks *Cap Trafalgar*, German armed cruiser off S. America.

15. Verdun relieved, its fortifications being now free from attack. Crown Prince's army retreating.

16. Great battle proceeding on a front of nearly 100 miles. Germans still falling back. Mr. John Redmond issues a call to the Irish people to form an Irish Brigade. Austrian losses since the taking of Lemberg are estimated at 250,000 killed and wounded, 100,000 prisoners.

18. Parlt. prorogued. King's speech says, "We are fighting for a worthy purpose and shall not lay down our arms until that purpose has been fulfilled."

19. Germans bombard Soissons. Brit. cruiser *Pygmaeus* disabled in Zanzibar harbour by German warship *Königsberg*. German cruiser *Emden* active among British merchant vessels in Bay of Bengal.

20. Germans bombard Rheims and destroy a great portion of the cathedral.

21. French capture 20 German supply motor cars with all their staff and a number of prisoners. Bombardment of Rheims continues. German post at Shuckmannsburg near the Zambesi surrendered to Rhodesian force.

22. Three Brit. cruisers (*Aboukir*, *Hogue*, and *Cressy*) sunk off the Hook of Holland by German submarines, over 1,000 lives lost, *Hogue* and *Cressy* torpedoed while trying to save lives. German cruiser *Emden* shells Madras.

23. British warships sunk or damaged, 10; German warships lost (including ships captured), 27; German merchant ships captured, 18; British merchant ships captured or sunk, 12. Allies still advance in the battle of the Aisne, having progressed about 12 miles in the region of Lassigny, and successfully

1914, Sept.—Oct.

- repulsed several German attacks. Russians occupy Soltau after defeating the German army.
24. French troops occupy Peronne, the key to the valley of the Somme.
25. 14th day of the Battle of the Aisne. Fierce attacks on the Allies by the augmented German troops. Australian Expeditionary Force capture German New Guinea, occupying the chief town and hoisting the British flag. Russians press their attack on Przemyśl with great energy; also capture Khyrov, about 20 miles S. of Przemyśl. First contingent of Indian troops arrives at Marseilles.
26. Malines bombarded for the third time, cathedral destroyed. On the eastern frontier of German S.W. Africa the police fort. Rietfontein, in the territory of the S. African Union, falls to German raiders. German patrol raid Walvisch Bay and capture a policeman. War contribution of nearly £400,000 by the Nizam of Hyderabad.
28. Germans open heavy artillery fire on the Waelhem-Wavre St. Catherine sector of the Antwerp defences. The German cruiser *Emden* continues its depredations in the Indian Ocean, having destroyed four more British merchant ships. British force captures the capital of the German colony of the Cameroons.
29. Germans attack the Antwerp forts, blowing up the Waelhem Fort.
30. Augmented German forces oppose the Russians on the East Prussian frontier, where a vigorous attempt to storm the Russian fortress of Osowetz is defeated.
- Oct. 1.** Further progress reported by the Allies to the north of the Somme and in the Southern Weuvre. Great greeting to Indian troops at Marseilles. The German attack on Antwerp continues, with increased vigour. H.M.S. *Cumberland* captures nine German merchant steamers of the Woermann line and a gunboat, off the Cameroonian River, West Africa.
2. 50th day of the war. Siege of Antwerp proceeds. Belgians retire across the Nethe, first blowing up the Waelhem Bridge.
3. In the Roze region the most desperate efforts are made to break through the Allies' line but without success. The siege of Antwerp is maintained. In the Eastern battlefield the Germans are in a somewhat serious plight. In their retreat across the Nienieu, the Russians drove at them and whole regiments were drowned.
4. A fierce engagement has developed in the region of Arras, the Allies assuming the offensive at many points, succeeding in the Argonne district in throwing back the enemy towards the north. A further Russian victory is recorded at Augustovo, where the Germans were defeated.
5. Grand Duchess of Luxemburg deported to, and interned, in a castle near Nuremberg. Nearly 600,000 men enrolled in the British Army since the outbreak of the war. Japanese forces before Tsingtau repulse a night attack made by the German garrison. The Japanese make an attack on the Marshall Islands (German), compelling the force in possession to surrender.
6. Germans endeavour to break across the Scheldt in order to cut off the retreat of the Antwerp garrison. Bombardment is now threatened. In East Prussia, where the Germans are falling back from the Russian pursuit, the railways close to the frontier are congested with trains. Export of British wool prohibited. Metropolitan police order general diminution and concealment of public and private lights.
7. German cavalry driven back to the north of Lille, and ground previously given between Chaulnes and Roze is retaken. Bombardment of Antwerp now opened with great vigour, the big German siege guns being brought to bear with deadly effect upon the forts. Germans cross the Scheldt at Termonde, Schoonabode and Wetteren. A British Marine Brigade and two Naval Brigades, representing a total of 8,000 men, enter Antwerp in aid of the Belgian garrison. The seat of the Belgian government is removed from Antwerp to Ostend.

1914, Oct.

- 30,000 refugees leave the city. First contingent of Canadian troops arrive in home waters. Submarine E 9 performs another daring exploit, penetrating to the mouth of the Ems close to the German coast, and there sinking a German torpedo destroyer. The E 9 sank the *Hela* on Sept. 13.
8. The bombardment of Antwerp continues, terrible destruction being dealt by the German siege guns, the Southern Station, the Hoboken oil tanks, and many important public buildings being set on fire. The suburb of Borgerhout also in flames. Antwerp at last falls and German troops enter. Two of the British brigades successfully retire with the Belgian Army; 2,000 of them are cut off and succeed in escaping into Holland. British loss 300. 50 German ships lying at Antwerp were blown up before the evacuation.
9. At Arras the deadly French gunnery is employed with splendid effect, blasting the enemy back; and in the Roze region 1,600 prisoners have been taken within the last two days.
10. In the great battle centre, between the Oise and Rheims, the Allies make progress to the north of the Aisne, particularly to the north-west of Soissons. Germans impose a war levy of £20,000,000 on Antwerp. Death of King Carol of Rumania; his nephew, now King Ferdinand, succeeds him.
11. Two German aeroplanes fly over Paris and drop 20 bombs in as many minutes, 4 persons killed and 20 injured. Fighting is briskly kept up on the East Prussian frontier, the Germans being driven back to the Masurian Lakes. The Russian cruiser *Pallada* (7,775 tons) torpedoed and blown up by a German submarine in the Baltic, 508 lives lost.
12. A German force enters Ghent and hoists the German flag. Another aerial raid upon Paris, 6 incendiary bombs dropped, but no great damage inflicted. Col. Maritz, who was in command of the British forces operating against German S.W. Africa, has produced a German general's commission and sent an "ultimatum" to the Union Government threatening a republic.
13. The town of Lille is the centre of a considerable new development. While held by a territorial detachment it has been attacked and occupied by a German army corps. Germans are now marching on Ostend. Belgian Ministry removes to Havre in France. Two of the submarines concerned in the attack on the Russian war cruiser *Pallada* (see Oct. 11) are attacked and sunk by Russian warships.
14. The Franco-British forces occupy Ypres. The Germans are pressed back by British troops on the left of the Allies' line. Meanwhile the Germans make a dash towards Calais, which now becomes their strong objective. Germans enter Buges. *Goben* becomes the Turkish flagship. Zeppelin brought down by Cossacks near Waraw. H.M.S. *Vermouth* sinks two supply ships to the *Emden*—the *Hanburg*, *Amerika* line steamer *Markomania* and the Greek steamer *Pontoricos* off Sun-tré.
15. German forces in great strength make the most vigorous attempt to advance on the way to Duikirk and Calais, but are resolutely held back by the Allies. On the main line of battle the Allies are making notable progress. In the Rheims district the Allies carry German trenches. Germans enter Ostend. H.M.S. *Hawke* is attacked by German submarines in the North Sea and sunk.
16. The battle of the Yser is now considered as practically ended without any decisive result except to shift the main action to the North. A gigantic battle is in progress between the Russians and the Austro-German forces at points near Przemyśl and Warsaw; the Russians have taken the upper hand and are said to have captured 20,000 men and 42 guns.
17. The new light cruiser *Undaunted*, commanded by Captain Fox, formerly of the *Amphion*, and accompanied by four destroyers, engages and sinks four German destroyers. An Austrian army attempts to force a passage across the San in Galicia but is promptly repulsed. Anglo-Japanese forces bombard the German fortress of Tsingtau, both by sea and

1914, Oct.

air. A Japanese cruiser sunk by a mine in Kiao-chau Bay, 500 lives lost.

18. The German forces have been considerably reinforced for the projected advance on Calais, with England an early object of attack after Calais is reached. The British armed liner *Carnegie* brings in to Halifax, Nova Scotia, the German oil-tank steamer *Brenthula*, captured while flying the American flag.

19. Germans repulsed between the Somme and the Oise; developments favourable around Lille. British fleet co-operates with the Allied Army in the movements against the Germans at Ostend and along the coast. The attitude of Turkey becomes more menacing, it being evident that some closer understanding than has hitherto been avowed exists between Germany and the Porte.

20. A two-days' battle has been raging in Belgium, the Germans attacking vigorously on all parts of the front, on the extreme north, where the enemy has been held back, and at La Bassée and other points, along to the heights of the Meuse, but being beaten back everywhere. British monitors still firing on the German batteries near the coast. The *Emden* continues her exploits in the Indian Ocean, having sunk or captured five more British merchant ships. The Czar issues a decree prohibiting the sale of alcohol throughout the empire for ever by the Russian Government.

21. The struggle on the Belgian coast is one of the most spectacular conflicts ever waged, being prosecuted on sea and land and in the air with intense vigour on all sides. The British warships are proving of striking value in the operations, having done deadly execution in shelling the German trenches. Counter attacks by the enemy prove quite ineffective. At the other side of the war, where Russia is bearing so overwhelmingly down upon Germans and Austrians, the enemy is mastered in almost every direction. The German troops—an immense force—advancing towards Warsaw, have been brilliantly thrown back and are now in full retreat, utterly routed, leaving their wounded behind them in their haste to escape the pursuing enemy.

22. The Belgian coast battle, upon which the Germans are staking so much as being maintained with desperate energy. The British gunners continue the bombardment of the German bank with great success. Further to hamper the enemy, the dykes near the Yser are cut, the effect being to cause the whole district to be flooded at high tide. In other northern directions all German attacks are proving futile. In the country around Warsaw the Germans have been driven back for a distance of eight miles, and so serious has the position become that the Kaiser, his staff, and horde of protectors retire from Czernowidowa.

23. The Germans still show a determined attack on the greater part of the fighting line, extending from the Swiss frontier to the North Sea. The general situation continues to be favourable to the Allies. Three Krupp batteries destroyed north of the Arne. Another moving German cruiser, the *Agrotide*, which, together with six or seven other similar vessels, has hitherto kept clear of contact with British, French or Russian warships, appears on Atlantic waters, destroys 13 British merchant ships, and successfully eludes capture.

24. 81st day of the War; 5th day of naval flotilla attack on German land forces. The Germans gain some ground near Dunkirk in Belgium, and also secure a limited advantage near La Bassée. To set against this, the Belgians win their way a little distance beyond Neuport in the direction of Ostend. French guns wipe out three more German batteries (18 guns) on the heights of the Meuse; and in the Argonne the Allies capture the key to the Aisne valley. Roulers falls into the possession of the Germans again. The British destroyer *Harrier* (Commander Charles Freemantle, R.N.) sinks a German submarine off the Dutch coast.

25. The Allies gain some little advantage in the direc-

1914, Oct.

tions of Roulers and Lille; and the Germans have crossed the Yser, the order having been given that this must be achieved at no matter what cost, and the enemy's loss here is about 5,000. At Ypres a contrary result is attained. There, although greatly reinforced, the Germans were held in check for five days by a British force which ultimately saved the position and threw the enemy back 15 miles.

26. The Russians continue their ceaseless harassing of the fleeing Germans in Poland. Germans evacuate Lodz. Muritz, the South African rebel commander, attacked at Kahanas by the South African forces and totally defeated, taking refuge on German territory. The French steamer *Amiral Ganteaume*, having on board between 2,500 and 2,600 Belgian and French refugees, was blown up by a torpedo when some distance out from Calais. The fortunate presence of the Channel steamer, *British Queen* in the vicinity enabled all but from 30 to 40 passengers to be saved.

27. The French destroy several German batteries by their artillery fire between Soissons and Berry-au-Bac, to the east of Nancy. The French have driven the Germans out of French Lorraine. A marked advance is made by the Russians in Poland. The German army, which had confidently counted on taking Warsaw, has now been driven back beyond Lodz and Radom. Further rebel movement, headed by Christian de Wet, reported from S. Africa. A British merchant ship, *Manchester Commerce*, struck a German mine and foundered off the coast of Ireland. Captain and 13 of the crew lost, 30 people saved. 14,000 British troops are lying the Suez Canal. Prince Maurice of Battenberg dies from wounds 251,000 German losses admitted in the first six weeks of the war.

28. On both frontiers the war goes against the Germans. Along the border of Belgium and in Northern France they are unable to break the front of the Allies. The Russian armies on the Vistula are pushing forward in all parts of their long front. A counter attack attempted by the retreating enemy north of Radom is overwhelmed and costs the Germans a loss of 49 officers, about 5,000 men, and many guns.

29. Further official reports from Petrograd accentuate the importance of the Russian victory in Poland. The resistance of the whole of the German armies on the Vistula is broken and the enemy continues in full retreat. Further south the Austrians are again defeated, and the Russians re-occupy Czernowitz. Turkey commits definite acts of hostility against Russia by allowing the *Breslau* and *Hamtshel* to bombard Russian ports. Prince Louis of Battenberg resigns his position as First Sea Lord of the Admiralty. Admiral of the Fleet Lord Fisher succeeds him.

30. Lille is taken by the Allies; and the Bavarians, whom the Kaiser wished might "meet the British just once," are badly beaten by them. The Turks, having taken the offensive against Russia, are doing much damage among the Russian ports of the Black Sea.

31. Sea, their warships chief among which are the *Goben* and the *Breslau*, having bombarded Odessa and damaged some of the Russian destroyers. Joint Note of protest to Turkey is sent by the Entente Powers. On the Eastern frontiers the Russian armies are still engaged in pursuing the defeated German and Austrian armies. In South Africa, Beyers has had his commando dispersed. The German cruiser *Emden* is again active, making a brilliant reappearance in the roadstead of Penang, flying the Japanese flag, and repainted and otherwise disguised. She succeeded in torpedoing two war ships—a Russian cruiser and a French destroyer. The British Hospital Ship *Kohila* wrecked off Whitty; many lives lost, but a large proportion saved by heroic exertions and endurance. Court martial opens at the Westminster Guildhall on a German spy named Carl Hans Lodge.

32. 88th day of the war. Reinforced by a great body

1914, Oct.—Nov.

of fresh troops, the Germans attempt a general and intensified resumption of their offensive in France and Flanders. Marked changes in the battle front result; the enemy's forces, who were in partial occupation of Ranscapelle, are driven back beyond the Nieupoort—Dixmude railway line, losing numerous prisoners and leaving many wounded on the field. The bombardment continues with violence, and the flooding between the Yser and the Nieupoort—Dixmude railway renders the German trenches untenable. The London Scottish troops make a splendidly successful charge at Ypres. H.M.S. *Hermes* is torpedoed in the Straits of Dover and sunk by a German submarine; all the crew saved except some 45 men. General bombardment of Tsingtau begins. Indian troops co-operating with the Anglo-Japanese forces there.

Nov. 1. Superhuman efforts continue to be put forth by the German forces in France and Belgium to maintain their positions. Reserve after reserve is brought up and thrown into the battle line. In one week—Oct. 12-20—the Allies took 7,083 prisoners. The German losses in this Battle of Flanders alone are said to amount to 125,000. In Poland, the German retreat becomes daily more pronounced, the Russian front now running through Piotrkow, more than 60 miles from Warsaw and 60 miles from the German frontier. In Galicia the enemy failed to dislodge the Russians from the league of Przemyśl, which is now in ruins. The Russians make heavy captures and recapture important towns. From 2,000 to 3,000 Bedouins invade Egyptian territory. British, French and Russian ambassadors leave Constantinople.

2. The Germans are evacuating their trenches on the left bank of the Yser and are concentrating an immense force with the object of retaking Ypres. The Admiralty announce the closing of the North Sea to shipping, except under conditions which give safe passage to innocent neutral vessels. German attempts to take the offensive on the borders of East Prussia are repulsed by the Russians. The German raiding cruiser *Kaiserlich* sinks three more British merchant ships. The German annoured cruisers *Scharnhorst* and *Gneisenau* arrive at Valparaiso (after their attack on the *Monmouth* and *Cape of Good Hope*, see Nov. 4), and after taking in provisions leave during the night.

3. The forts at the entrance to the Dardanelles are bombarded by the Anglo-French fleet; and the fort of Akaba, close to the Egyptian frontier, has been shelled by the British cruiser *Minerva*. Martial law is proclaimed in Egypt. Early this morning an enemy's squadron fired on the *Halcyon*, a coastguard gunboat engaged in patrolling. This being reported, various naval movements were made which caused the squadron to make a rapid retreat, and when beaten off, the rearmost cruiser, in making its escape, struck a number of mines, one of which was thruck by Submarine D 5, exploding her.

4. The enemy is concentrating in great force for a final assault on the line between Ypres and the Lys, and the position of the Allies has been strengthened. British artillery has done "prodigious slaughter." The Indian troops win great praise for their splendid bravery, and Sir John French sends a special message of congratulation to the London Scottish for their "glorious lead." Up to now the tremendous sacrifice of German lives has availed the Germans nothing. The Germans now hold only a single position on the left bank of the Yser. The German troops, driven back from Warsaw a distance of 20 miles, to within 30 miles of their own frontier, are still in retreat. They capture 15,800 Austrian prisoners and scores of guns. Bombardment of the Dardanelles by the Allied fleets has resumed. Russian troops enter Turkish territory and after some fighting capture Zivne, Kara Kilise, Passinka and other places, and are threatening Erzerum. Admiralty's report of Naval battle between German and British ships off the coast of Chili [Nov. 1] issued to-day, showing that the *Good Hope*, *Monmouth*, and

1914, Nov.

Glasgow cruisers engaged the *Scharnhorst*, *Gneisenau*, *Leipzig*, and *Dresden* in stormy weather, the action lasting an hour. The *Good Hope* caught fire, blew up, and sank; the *Monmouth*, also on fire, drew off, but was again attacked, her fate being not yet known. The *Leipzig* was not greatly damaged, and has few casualties. Bombardment of Tsingtau continues. The Austrian cruiser *Kaiserin Elisabeth*, which was in the harbour when the siege began, has been blown up by the Austrians. Sir Percy Scott is appointed Naval Assistant to the First Sea Lord. Cyprus annexed by the British Government. Nominally belonging to Turkey, Cyprus had been occupied and administered by Great Britain since 1878, by virtue of a Convention by which an annual tribute of £2,800 was paid to the Sultan. It now becomes entirely British. The *York*, German cruiser of nearly 10,000 tons, is sunk off Wilhelmshaven by a German mine.

5. Great Britain declares war against Turkey. Turkish Ambassador leaves London.

6. The Allies make a marked advance to the south of Dixmude and towards Gheluwe. Particulars of the great retreat from Warsaw are to hand to-day. It is shown that the Russian armies, dominating a front stretching from the Baltic to the Carpathians, have overwhelmed the first resistance of the Austro-German forces at every point. Since the advance towards Warsaw, many things have surprised them. First, they were held up on the west bank of the Vistula by a sudden concentration of Russian columns. From that time the enemy's forces were driven rapidly back. On the south of Piltzta, at Radom, at Sandomir, and along the valley of the San they tried to stem the tide of retreat, but without avail. Then at Kielce, some fifty miles due west of Sandomir, the Russians went into occupation on Nov. 3; after that Jaroslavl fell to them, and so the armies of the Grand Duke Constantine swept along to the German frontier. The spy *Lody* is shot at the Tower.

7. Russians cross the German frontier north-west of Kalisch and are on the direct route towards the heart of Germany; the advance continues with equal steadiness in East Prussia and Austrian Galicia. Russians capture positions from the Turks only 33 miles from Erzerum. On the Black Sea the Russians bombard two small ports, near the Ereget coasts.

8. German troops are being withdrawn from Brussels, Louvain, and Antwerp. Their big guns, which were being brought up towards Arras and Lille, have been sent away in the night. A grand final effort to "smash through" to Calais or Boulogne, however, is being prepared, the chief point of attack at present being Ypres, now largely defended by British troops. The Germans abandon Comstockowa and Kalisch, and the Russians successfully invade the province of Posen in Prussian Poland, no German troops being now left in Russian Poland. In Galicia the Austrians abandon all their positions along the lower San.

9. 9th day of the war. The Germans still retain some positions on the left bank of the Yser, and between Dixmude and the Lys renew aggressive movements, all of which are repulsed by the Allies. On the Eastern Cameroons near the Congo, a force of French troops under General Aymerich has performed a brilliant feat in expelling the Germans from a large part of the territory. The German cruiser *Geier* at Honolulu, having outstayed the allotted time for an injured belligerent, has been interned by the U.S. authorities. The German steamer *Locksley* is also interned with her.

10. The Admiralty makes official announcement of the capture and destruction of the German raiding cruiser *Emden*, at Keeling (Cocos) Islands, in the Indian Ocean, by H.M.S. *Sydney*. The *Emden* was caught and forced to fight, with the result that she was driven ashore and burnt. The German cruiser *Schwartzburg* has also been forced out of harm's way, she was discovered on Oct. 25 by H.M.S. *Chatham*, hiding in shoal water about six miles up the Rufiji River, opposite Mafia Island, German East Africa. Owing to her greater draught, the *Chatham* could

1914, Nov.

not reach the *Königsberg*; steps were taken, therefore, to block her in by sinking colliers in the only navigable channel, pending operations for her capture or destruction. The right wing of the German army in East Prussia is defeated, the Russian advance continuing along the whole front. Russian ships sink three Turkish transports in the Black Sea, the vessels containing troops, aeroplanes and uniforms.

11. 99th day of the war. The fighting in Flanders is less favourable to the Allies, the Germans renewing their attack "with most peculiar intensity," and succeeding in occupying Dixmude. The Allies, however, continue to hold the outskirts of the ruined village, and advance beyond Lombartzeville in the coast region. From the East the news is good. The Germans make active preparations to resist the Russians at Thorn, as the Austrians are doing at Cracow. About 22,000 German prisoners taken. H.M.S. *Niger*, a gunboat built in 1892, torpedoed and sunk by a German submarine in the Downs; officers and crew saved.

12. The enemy is making a stand near Thorn in East Prussia, bringing up 1,000 guns to defend their position against the advancing Russians. Supplementary Estimate issued for 1,000,000 more men and £225,000,000 more for the war, including advances to Belgium and Serbia. British casualties up to Oct. 31, 57,000 (killed, wounded, and missing).

13. The guns bear the principal part in the fighting along the left flank of the Allies to-day. The results of the enemy's efforts during the last few days are thus summed up in the *Paris communiqué*: "He has won Dixmude, a village smitten to ruin by the breath of the guns, and has found it a barren conquest." Russian troops occupy Tarnow. The Santa Claus ship *Jessen* sails from New York with millions of Christmas presents from America's children for the children of belligerent nations. Lord Roberts died at the headquarters of the British Army in France.

14. The German forces are once more thrown back over the Yser, a submarine is sunk off Westende by being rammed by a French torpedo-boat. Turkish forts at the southern end of the Red Sea are captured by Indian troops, assisted by H.M.S. *Duke of Edinburgh*. It is now confirmed that the naval action in the Pacific (see Nov. 4th) was fought by four German warships, the *Gneisenau*, *Scharnhorst*, *Leipzig* and *Dresden*, against the *Good Hope*, the *Monmouth* and the *Glasgow*. Six German warships and an Austrian cruiser, it is now reported, were discovered sunk through explosion in the Tsingtau harbour on the Japanese and British taking possession.

15. The Germans continue in possession of the ruins that was once Dixmude, and make a further attempt to cross the canal, without the command of which the possession of Dixmude is worthless, but are defeated. German attacks are being repeated near Ypres and repulsed every time. The Prince of Wales is now at the front in Flanders, taking up a position on the staff of General French. Mr. Aquith moves a vote of Credit for £225,000,000, of which £44,000,000 is to be devoted to loans; £30,225,000 to Canada, Australia and New Zealand; £10,000,000 to Belgium; and £300,000 to Serbia. The vote to carry the country on to March 31. The Home Secretary stated that 14,500 alien enemies are now confined in concentration camps in this country, and that 29,000 are still at large.

16. The Allied forces press forward in the neighbourhood of Brüsselotte, and German attacks are repulsed south of this village also south of Ypres. A brilliant bayonet charge by Zouaves carries a wood after its being in dispute between French and German troops for three days of indecisive fighting. Two heavy attacks of the enemy on the British Third Division are successfully resisted, the Germans being driven back in disorder for 300 yards. The Chancellor of the Exchequer produced his War Budget. The War Loan of £250,000,000 is to be raised at once. Issued at 95, it will bear interest at 3½ per cent., and will be

1914, Nov.

resumed not later than March 1, 1928, being in effect a 4 per cent. security. The additional taxation rendered necessary is to be met by doubling the income tax and super-tax, but for the current year only payable in respect of one-third and by increasing the tea-duty from 5d. per lb. to 8d. per lb. and the beer-duty to the extent of 1d. per half-pint.

17. The advantage of the day in Northern France and Flanders, after many fluctuations, remains solidly with the Allies. The Germans have not pushed forward one mile on their march to Calais. British warships bombard the entrance to the Zeebrugge ship canal to Bruges, and destroy the Colmay factory which the Germans have been using for military purposes. The Russian official *communiqué* states that the Russian advance-guards opposing the Germans, who took the offensive, are falling back in the direction of the Bzura. On the front of the Mazurian lakes the Russians reach the wire entanglements of the Germans and force them. A German squadron bombard Lithau, a Baltic port, causing several outbreaks of fire. The Russian Black Sea Fleet cannonade the forts and barracks at Trebizond. Numerous battles are raging in Poland, near Thorn, where General Hindenburg has evidently succeeded in checking the centre advance of the Russians.

18. Funeral of Lord Roberts in St. Paul's. The battle-cruiser *Gordon* severely handled and set on fire by the Russian Black Sea fleet off the Crimea; her superior speed enabled her to escape. In the Shatt-el-Arab region, a British force inflicts defeat on Turks with great loss. British losses at sea to date: Total casualties, 4,128; Officers, 264; Men, 3,864. Of these, 222 officers and 3,455 men were killed.

19. British Govt. prohibit export of tea from this country except to the Allies and to Spain and Portugal. Export of rubber also stopped.

20. Ypres still in the hands of the Allies. In the Eastern battle ground Von Hindenburg continues his attempt to advance on Warsaw, reaching a point within 40 miles of the Polish capital. Three British aeroplanes make a raid on the Zeppelin factory at Friedrichshafen on Lake Constance, dropping bombs and doing considerable damage; one airman (Commander Briggs) captured.

21. German guns specially active in the Ypres, Reims and Soissons region, adding destruction to destruction. Von Hindenburg's advance on Warsaw is successfully checked, his army of 400,000 is broken up into several parts. Basrah captured by Anglo-Indian troops. In German East Africa, however, an attacking body of Anglo-Indians is overpowered by superior numbers and loses 795 officers and men. German submarine, V 18, is rammed by a British warship off the coast of Scotland. Crew of 26 saved with the exception of one man. German destroyer, S 22, rammed by the United States Shipping Company's *Anglo-Dane*. Herin, one of the smallest of the Channel Islands, leased to a German Company in 1889, taken possession of by British troops.

22. The new German naval base under construction at Zeebrugge shelled and destroyed by British and French warships. Further success for the Russian army in Poland, Von Hindenburg said to be in retreat.

23. At 7.53 this morning the *Bulwark* battleship, lying in Sheerness harbour, blew up and entirely disappeared, nearly 800 lives being lost. Only 12 saved.

24. The activity of German submarines in the Channel does not cease; two British merchant ships have been sunk off the French coast. Mr. Lloyd George announces in the House of Commons that the War Loan of £350,000,000 has been oversubscribed. Mr. Churchill declares that by the end of next year our Navy will be increased by 15 new Dreadnoughts as against three added to the German fleet.

25. The struggle in Poland grows fiercer and desperate. Before 1.0.2, General von Mackensen's army is vigorously resisting the encircling movement of the Russian force, while an attempt is being made by the German Army at Lodz to break through to its rescue to the north. On the whole, however, it

1914, Nov.—Dec.

seems doubtful whether General von Mackensen will be able to extricate the remnant of his army safely.

29. Almost under the walls of Cracow, the Russian army of Gallici wins a signal victory, 25,000 Austrians have been taken prisoner within the next fortnight. A long despatch from General French, describing the work of the British Expeditionary Force in the Battle of Flanders, is issued. "No more arduous task," he writes, "has ever been assigned to British soldiers; and in all their splendid history there is no instance of their having answered so magnificently to the desperate calls which of necessity were made upon them." The King leaves on a visit to France.

30. The King at headquarters in France. The issue of the great battle in Poland is still in doubt, but the Germans are a long way from safety. The mass of the German Army is disposed upon a main front of about 120 miles that runs in a broad curve from Sieradz, passes just west of Lodz and Lowicz, and thence goes almost due north to the line of the Vistula at Plock. From above the centre of this line a subsidiary front goes for about 25 miles almost due south through Brzeziny to Tuszyn. Between Lodz and Lowicz two German army corps were almost destroyed, but cut their way out with heavy loss by the aid of reinforcements opportunely flung in. The Russians are striking at the German left, have stormed Sobota (a few miles west of Lowicz), and have advanced to the attack of German entrenched positions at Leczyca, right in the rear of the main German line.

Dec. 1. King George visits base hospitals containing British, Indian, and German wounded in France. Two advances are made by the Allies; between Bethune and Lens the château and park of Vermelles are carried by assault; and in the Aronne an appreciable advance is made in the woods of La Gurie. The battle in Poland continues with unabated determination on both sides. In the Carpathians the Russians win successes which give them the command of important passes. De Wet is captured by the S. African forces.

2. In Poland the Germans rally. A new army from the West is flung in at Kalisz and is a factor of importance. In the region west of Lowicz the enemy attack the Russian front on the line from Brelaw to Sobota, which was stormed by the Russians on Nov. 30. The Russians retake Strykow and thus regain possession of the Lodz-Warsaw railway. The new move of the Germans seems to have been effectively countered so far, and meanwhile the Russians push vigorously towards Cracow.

3. The Russians are only 31 miles from Cracow's outer ring of fortifications. The advance upon Cracow has been difficult and costly, conducted in its later stages in a temperature 25 degrees below freezing point. Strong reinforcements are being pushed forward by the Germans against the left wing of the Russian army operating before Lodz, a large proportion of the new troops being drawn from the Western front.

4. On the Western battlefield events develop slowly, while the operations in the Vosges and Alsace claim attention with the siege warfare in Flanders. French attacks are made north-west of Altkirch in Alsace. At a point nearly six miles north-east of Ypres the Germans made an infantry assault but without success. The Allies capture 991 prisoners in the northern region alone.

5. A forced retirement of several kilometres in North France is admitted by the German Staff. The enemy's positions at the village of Vermelles became untenable owing to the French artillery fire and are evacuated, the Germans retiring to new positions to the east of Vermelles. The village was completely destroyed before the evacuation. General Botha announces that the rebellion in the Orange Free State is practically crushed. King George returns to London from France.

6. The Allies capture and strengthen a position across the Yser, destroy a German fortification and do considerable damage to the enemy's guns. At several points the heavy artillery of the Allies has quite out-classed the German weapons.

1914, Dec.

7. The 25th day of the war. The Germans claim to have captured Lodz and put the Russians in retreat. The Allies continue to advance in France, generally taking the offensive, and appreciable progress is made in several directions. In the day hours of this morning the Germans make an attack by armoured motor-boats on the Belgian lines south-east of Rams-capelle near Peroye. It was a battle by flood and searchlight and the Belgians met it with characteristic bravery, ultimately driving the Germans back. Turkey's cruiser *Hamidieh*, damaged by a mine, has put into Constantinople with difficulty.

8. The Russians have again evacuated Lodz. On the Western front a violent attack is made by the Germans on St. Eloi, south of Ypres, but fails. Meanwhile the British fleet open a bombardment of the German trenches between Nieupoort and Ostend, the land forces of the Allies acting in conjunction with the naval operations. General Beyer meets his death in the Vaal River, across which he was escaping from pursuit, having been wounded. Four German warships—the raiding cruisers *Scharnhorst*, *Gneisenau*, *Nürnberg*, and *Leipzig*—sunk off the Falkland Islands by a British squadron commanded by Sir F. Sturdee. The engagement lasted five hours and the *Dresden* escaped.

9. It is announced that Lodz was evacuated by the Russians at midnight on the 5th Dec., in conformity with a well-considered plan, without the loss of a man, and that the Germans did not enter the town until the following afternoon. In Western Galicia the German forces suffer a grave defeat, a German corps from Belgium having been put to flight.

10. The third attempt of the Austrians to carry out an effective invasion of Serbia is made, the enemy being disastrously defeated near Valievo, and compelled to retreat with losses in men estimated at 30,000 and in guns at 50.

11. The Germans make another attempt to "smash through" the Allies' lines near Ypres but without success. British cruisers shell the Belgian coast in the Nieupoort region. The French capture the railway station of Aspach, south of Thann in Alsace. Three separate engagements take place on the Eastern frontier of Germany. Near Mlawka the Germans made desperate attacks all yesterday and during the night and were repulsed. A Russian counter attack then drove back the enemy's columns. The Serbian army still pursues the Austrian invaders, and thousands of prisoners are being brought into Nish. The French Government returns to Paris.

12. A new battle of Ypres is developing even less favourably for the enemy than before. Three more violent attacks have been repulsed. On the Eastern front the Russians successfully withstand several fierce attacks in the Lowicz—Warsaw direction.

13. British submarine B.11, in spite of difficult currents, dives under five rows of mines in the Dardanelles and torpedoes the Turkish warship *Messudiyeh*, of 10,000 tons. The Serbians continue their chase of the Austrians, who are said to have 30,000 Bavarians with them. Several thousand more prisoners are taken.

14. A change in the German plan of operations in Poland seems to be developing. The advance from East Prussia to the north of Warsaw having been thrown back the troops have been withdrawn over the border, and some of them sent south to assist the operations south of Cracow. Here troops are being massed, aided by bodies of Austrians who have crossed the Carpathians from Hungary. The Serbians re-enter Belgrade after a desperate battle. In the Caucasus the Turks have suffered a severe reverse at the hands of the Russians, and have been driven across the Euphrates, which extends from the Persian Gulf to a point within 50 miles of the Black Sea.

15. All along the western front the Allies gain advantages. A combined attack on the lines from Hollebecq to Wytschaete resulted in the capture of several German trenches and a number of prisoners. By a debouching movement, from Nieupoort, French and Belgian troops occupy the line from the western border of Lombardzyde to the farm of St. Georges,

1914, Dec.

while to the south of Ypres attacks made in the direction of Klein-Zillebeke represent an advance of 550 yards. In the regions of the Aune, the Argonne, the Meuse, and the Vosges similar progress is reported. There is but one exception—the village of Steinbach in the Vosges—which has been lost to the Germans together with several hundred French infantry. In North Poland the Germans admit a serious reverse. The column descending southward from East Prussia through Mława has not been merely checked, but, to quote the German Headquarters' Report, "it has had to occupy its former positions in consequence of superior hostile forces." In plain English, it has had to fall back again into East Prussia. The Austrians are pouring over the Carpathians and concentrating large bodies of troops on the left bank of the Vistula.

16. A German cruiser force made a raid upon our North-East coast, shelling Scarborough, Whitby, and Hartlepool, between 8 and 9 a.m. A British patrolling squadron tried to cut them off, but, favoured by mist and superior speed, they succeeded in making good their escape. Prominent buildings were struck, 120 persons killed, and over 400 wounded.

17. In view of the state of war arising out of the action of Turkey, Egypt is now placed under the protection of Britain. This is the announcement given out by the Foreign Secretary to-day. Egypt, which includes the Sudan, covers 1,300,000 square miles and has a population of 13,000,000. The Khedive is virtually deposed.

18. On both sides of the Western field—in France and in Flanders—serious progress is made, the weight of the offensive being with the Allies. In Poland, the German advance along the left bank of the Vistula, which has already brought them to Sochaczew, is still being pressed forward. German troops are also concentrating upon Łowicz, Piotrków, and Wielun, where the Russian centre is entrenched before the main railway through Poland. Łódź appears to have been evacuated now by the Germans as of no particular value, and the force which descended into North Poland by way of Mława has been driven back over the East Prussian frontier. Prince Huysen Kameh Pasia, eldest living prince of the family of Mehemet Ali, has been offered and has accepted the title of Sultan of Egypt in place of the ex-Khedive, now deposed.

19. The Allies gain further ground before Nieuport and St. Georges, as well as east and south of Ypres, north of La Bassée, and north-west of Arras, while the positions east of Vermelles have been maintained. British troops lose some trenches near Neuvechappelle. The Russians are now holding the line of the Bzura and Rawka rivers, 30 to 40 miles south-west of Warsaw, and after some obstinate fighting to-day cut up a German force which had closed the Bzura at Dachowa, immediately south of Sochaczew. The trial of Captain Fourné, a ring-leader of the South African rebels, concluded to-day. Found guilty and subsequently shot.

20. From the Łódź to the Vistula the situation is one of standstill. The defeat of the German force that descended into North Poland by way of Mława has freed the Russian right wing to some extent, enabling the Russians to draw up their forces in Central Poland towards the Vistula to guard against an enveloping movement. This movement may explain the evacuation of Łódź. Vast changes of a decisive character are taking place in S. Poland. The Piłtza has been crossed and the Austro-German lines have even reached Opoczno, an important point towards Radom, and the enemy has also obtained possession of the great trunk railway from Warsaw to Czenstochowa. Cracow has been relieved.

21. The steady maintenance of pressure by the Allies on the Western front continues, notably between the Argonne and the Meuse, where comparatively long distances have been gained. In the Eastern battlefield great activity prevails on both sides. The Russians claim that the Germans in the Mława region have been driven back, that the Austrian offensive

1914, Dec.

has been definitely checked, and that the operations have assumed a character "perfectly favourable to the Russian arms."

22. The Allies make progress at many points in the west. In Champagne and the Argonne fierce bayonet fighting has resulted in the storming of three German entrenched positions, covering a front of a mile, near Perthes-les-Hurlus, which is three miles east of Souain on the road to Ville-sur-Tombe. Further along this road, on the outskirts of the Argonne, the Allies have made good their capture of another mile of trenches at Beausjour.

23. The Allies steadily push their way along the beach and sandhills to the north of Nieuport, the guns of the Anglo-French bombardment squadron materially assisting this important movement. In Poland formidable preparations are in progress for an advance upon Warsaw, the Germans being now well within 30 miles of the city, and are said to be bringing up their great 42 centimetre mortars ready for siege operations.

24. The German attempt to reach Warsaw weakens and further south the Austrians have been severely punished at several points, a large force being in full retreat in Western Galicia.

25. Seven British naval seaplanes make an attack at daylight on German warships lying in Schilling Roads off Cuxhaven, escorted by the *Arctis*, the *Undaunted*, a destroyer flotilla and submarines. Our ships while standing by to pick up the seaplanes were themselves attacked by enemy Zeppelins, seaplanes and submarines, beating off the attack, and succeeding in picking up six of our seaplanes after they had discharged bombs "on points of military significance." The seventh seaplane was afterwards seen in a wrecked condition off the coast of Heligoland, and the fate of its pilot, Flight Commander Francis E. T. Hewlett, was not known until some days later when it turned out that he had been picked up by a trawler and was in Holland.

26. Mława is retaken by the Germans. This indicates another attempt to thrust back the Russian left flank.

27. The French hold the trenches captured near Puiseleine on the heights of the Meuse, consolidating the occupation of the ground near Caumont. On the Eastern Front the enemy is fought to a standstill for the time being, and the Russians are confident of their ability to hold him in check. Further south the Austrians are being driven back.

28. The Russians are massing forces on that section of the Lower Vistula which includes the railway there, and are in great strength in the region of Plock and thence to the Warsaw front.

29. The 80th day of the battle for Calais. The Allies take and establish themselves in the village of St. Georges. In Upper Alsace they are closely investing Strasbourg after a violent action and have seized a position north-west of the town. The main fighting on the Eastern frontiers is now centred on the Upper Vistula and to the South. The Austrian advance, meanwhile, through the Carpathians has been driven back in the utmost disorder. Russians claim to have made 50,000 Austrian prisoners during the first half of December. The Government of the United States has addressed a Note to the British Government protesting against the treatment of American commerce by the British fleet, by which, it is asserted, the rights of American citizens under the laws of nations have been infringed.

30. A German squadron of aeroplanes attacked Dunkirk this morning. Four machines flew over the town and dropped bombs, while a fifth hovered in the distance as "sentinel." 25 persons were killed and 32 wounded. The Allies who ground near Nieuport, strengthen their hold on Ypres by carrying a German point of vantage on the road from Becelaers to Paschendale, and on the right of their line pushed forward in the Argonne. The Russians make further progress in Galicia, several fortified works being captured and 44 officers and 1,500 men made prisoners. South-west of Dukla the enemy's forces are driven in a panic from strong positions.

31. In Upper Alsace the French enter Steinbach and

1914, Dec.—1915, Jan.

"carry half the village house by house." In the region of Beauséjour the Allies make ground, repulse a German counter attack, and again push forward as the enemy's troops fall back unsuccessful. Between the Meuse and the Moselle the French take over 150 yards of the enemy's trenches. Following their repulse on the Bzura, the German attacks on the Rawka are now weakening, the Russian heavy artillery having been brought up and used with great effect, the Government of the Union of S. Africa has decided to commandeer men for service in the forces operating against German South-West Africa. It is expected, however, that compulsion will not be necessary. Meanwhile, the Union troops re-capture Walvisch Bay. The rebel Maritz is again showing activity without opposition.

1915.

Jan. 1. The battleship *Formidable* is sunk this morning in the Channel by torpedoes fired from a German submarine. She had a complement of about 750 officers and men. A British light cruiser and a Brisham fishing smack save between them 190 lives. In Belgium the Allies hold St. Georges; in the Argonne the Germans win back some lost ground, but in turn are attacked by the French. The enemy makes desperate but unavailing attempts to drive the French out of Stenbach.

2. In Upper Alsace, the railway about Altkirch is bombarded; and at Stenbach more lines of houses are carried by the French infantry. There are violent artillery engagements about Nieuport, but against St. Georges the enemy abandons his counter-attacks.

3. In the Ulva region of the Eastern battleground the enemy's offensive is foiled, but south of the Vistula his attacks are very stubborn.

4. The two chief centres of activity in the Western battleground are still Upper Alsace and Champagne. In both the progress of the Allies is being steadily maintained. Berlin officially admits that Stenbach has been captured by the French. An important height west of Cernay is stormed and held, and Cernay itself, a mile or two away, is seriously threatened by the French advance. The situation in Poland is developing. The Germans are held up on the Bzura and Rawka rivers, and for a fortnight have made no progress in the direction of Warsaw. The advance into Bukovina has reached within a mile of the Rumanian frontier. British warships successfully bombard the German port of Dar Es Salaam in East Africa.

5. A complete defeat overtakes the Turkish army in the Caucasus. The battle is fought at an altitude of 10,000 feet on steep mountain ridges covered with snow, where almost no convoy or field artillery can be brought. Two Turkish army corps are routed, and the whole of the 9th Corps surrenders, amounting for 40,000 Turks put out of action. The pursuit of the remnant is vigorously followed up. Important gains are secured by the French in Alsace by pushing on towards Mulhouse, past the village of Cernay to the eastward of Vicux Thann, and silencing the artillery fire of the enemy to the east of Upper Burnhaupt. The French also succeeded in establishing themselves in the hamlet of Creux d'Argent in the Vosges. Near the village of St. Georges the Germans are driven back from their trenches to a distance of from 200 to 600 yards. Cardinal Mercier, Archbishop of Malines, is arrested by the German military authorities for issuing a pastoral letter to be read in the churches of Belgium, in which, while counselling Belgians to abide by the terms of surrender made to the Germans, he repudiated the existence of any right by which the Germans control Belgium.

6. Further reports concerning the defeat of the Turks in the Caucasus show the affair to have been the most wholesale putting out of action that has occurred since the war began. The retreat of the remnant was cut off by roads deep in snow, and, finding the situation hopeless, the Turks surrendered in masses. The battle lasted for 48 hours with great desperation. To-day a slight German gain is reported in Alsace, the enemy succeeding in

1915, Jan.

recapturing one of the "heights," on the east flank of the hill 445, though the French still hold its summit. Otherwise, the important gains made in Stenbach are successfully maintained. Lord Kitchener makes a statement in the House of Lords. With regard to recruiting, he says it has "proceeded on normal lines." He also states that the deficiency in the supply of officers is now made good, over 20,000 having been appointed since the beginning of the war.

7. The French advance in Alsace continues with unabated success, and they have now reached a point only about 24 miles west of Altkirch. They also maintain at all points the positions recently captured from the Germans. The report on the German atrocities in France is issued to-day. It is one of the most appalling records of wanton outrage ever given to the world. The sale of absinthe is prohibited in France.

8. Fighting is actively resumed in Belgium, between Westende on the coast and Lomiatztyde and in the neighbourhood of St. Georges, though progress is rendered difficult by the dreadful condition of the soil, which recent rains have turned into mud. In Alsace, the French make substantial progress, ousting the Germans from their trenches on the side of Hill 445 and gaining more ground on the slopes. Further south the French capture Burnhaupt-le-Haut, and some progress is reported towards Pont d'Aspach and Kahlberg.

9. In Poland, from the severity of the weather and other causes, von Hindenburg's armies are becoming weaker. The activities on the Western front increase. The Germans attack the positions recently secured by the French on the west of Perthes, but are driven back so effectively that 400 yards more of their trenches are captured on the flank of the point from which they attacked. At the same time the French by a direct attack secure Pertuisa village. Three lines of German trenches are taken at Soupir, the captured section extending for about 600 yards.

10. The Germans, strongly reinforced, recapture Upper Burnhaupt but sustain heavy losses. Soissons is violently bombarded by the Germans, the cathedral being badly damaged and the Law Courts set on fire. The Germans to-day make an attack on Spur 132, to the north-east of Soissons. This attack being repulsed, the French then capture the whole ridge by expelling the enemy from two lines of trenches, which they had retained since Jan. 3.

11. The text of the interim Note in reply to the Note from the American Govt. on contraband cargoes is published. Sir E. Grey declares that the Govt. cordially concur in the view that a belligerent's interference with neutral trade should be confined to the absolute limits necessary to protect its safety; and expresses the opinion that the extent to which we have interfered with trade has been over-estimated. It also gives figures showing the enormous increase in the exports of copper to Italy and other neutral countries contiguous to the enemy States. Further progress is made to the north of Perthes, the French once more attacking and capturing a line of trenches along a front of about 100 yards. The Germans make an obstinate attempt to regain the position lost to the north of Beauséjour, but are repulsed with heavy loss. German aeroplanes drop bombs on St. Malo-Baire near Dunkirk, and kill six persons. Sir Edward Grey's reply to the American Note on the subject of contraband cargoes appears to have created a good impression in the United States.

12. Count Berchtold, Austro-Hungarian Foreign Minister, resigns, being succeeded by Baron Buzan. The Turks occupy Tabriz in Persia, the capital of a province under Russian influence. The German movement near Soissons assumes a more determined character and the French lose some ground. Germans claim a victory on the hills near Crouy. Severe earthquake in the Lake Fucino district of Italy, great destruction and loss of life.

14. German success near Soissons, the Kaiser a spectator. In North Poland the Germans have been

1915, Jan.

driven back on two successive days. Turks in considerable force advance on Egypt.

18. The Russians take 5,000 prisoners and nearly 10,000 head of cattle from defeated Turks in the Caucasus. Fierce fighting continues in the Solissons district with fluctuating results. In front of Warsaw a new Russian offensive is developing north of the Vistula, on the German line of communication.

19. Air raid by British, French, and Belgian aviators on Ostend, doing much damage to the military works there. After a desperate battle lasting nearly a week the remnant of the Turkish army that invaded the Caucasus suffers disastrous defeat at Kara-Urgan. Their 12th Army Corps (40,000 strong) is annihilated.

20. The Allies win successes in the Neupont and Lombartzyde region, driving the enemy out of his trenches on the Great Dune and bombarding and destroying a redoubt and works near St. Georges.

21. The recent German success at Solissons is barren of result to the enemy unless he can extend the gap to right and left, so he revenges himself by wanton acts of destruction. The Russians are now invading Turkish territory and the plight of the Turks is desperate. Over 900 frozen corpses with rifles in their hands are found in one forest. In Poland the Russians re-occupy Ploetz.

22. A raid of German aircraft is made this evening on the East Coast, bombs being dropped on Yarmouth, Cromer, Lynn, Sheringham, and Sandringham. Three persons killed and considerable damage done.

23. Three successful infantry attacks are made by the Allies on the Western front, partly counter-balanced by a check to the French advance in Boile-Frèze. The Germans are driven out of certain of the Allies' trenches which they had occupied at Notre Dame de Lorette; and near Beauséjour, and in the Forest of Apremont they capture part of the enemy's positions and hold their guns. Allied armies make a raid on Essen.

24. The Glasgow steamer *Dunward* is sunk by a torpedo fired by submarine U 70. British air raid on Zeebrugge, damaging a submarine and causing many casualties. Simultaneously German aeroplanes drop bombs on Dunkirk, killing 9 people.

25. M. Millerand, French Minister of War, is received by the King and confers with Ministers.

26. Early this morning a British patrolling squadron sights three German battle-cruisers and an armoured cruiser, the *Blücher*, steering westward. The German ships turn and make for home, but are pursued and brought to action. The *Lion*, flying the flag of Vice-Admiral Sir David Beatty, leads the British line. The battle begins about 9.30. The *Lion*, *Tiger*, *Princess Royal*, *New Zealand*, and *Indomitable* are the British ships engaged; and opposed to them are the *Derfflinger*, *Seydlitz*, *Moltke*, and *Blücher*. A well-contested running fight ensues and shortly after one o'clock the *Blücher*, which had previously fallen out of line, capsizes and sinks. No British ships are lost; our casualties are 14 killed and 29 wounded. Of the *Blücher*'s crew of 885, 123 are saved, including the captain, who died of pneumonia on Feb. 16, 1915, in Edinburgh Castle.

27. The Kaiser's 56th birthday. Desperate attempts are made on sea and land to achieve victories in honour of the day, but the successes rest with the Allies.

28. Thousands of lives have been sacrificed to achieve a substantial feat of arms as a birthday tribute to the Kaiser, but defeat and heavy losses have been sustained by the Germans in nearly all directions. Great Britain arranges to lend £5,000,000 to Rumania.

29. In the three days, Jan. 25, 26, 27, the French communiqué states that the enemy's losses, judging from the number of dead found on the ground in the region of Ypres, La Bassée, Craonne, the Argonne, and the Woëvre, exceed 20,000.

30. Germans are again checked by the British at La Bassée, 200 dead being counted in front of the British trenches in the Caucasus and in Persia the Russians win successes against the Turks.

1915, Feb.

Feb. 1. The struggle for the mastery of the Carpathian passes continues to be most violent.

2. Parliament reassembles. This evening the Turks make an attempt to cross the Suez Canal at Toussoum, near Ismailia. They are allowed to bring bridging material to the bank of the Canal before being interfered with. Then British troops deliver an attack and the Turks fly in disorder.

3. In the Mlaw region the Russian advance threatens the left flank of von Hindenburg's army. In the Carpathians strong headway is being made by the Russians. The Austro-German armies in that quarter, however, are becoming overwhelmingly strong, numbering over 500,000 men. The fighting is along a front of 80 miles.

4. The German Marine Staff declares a blockade of the British Isles from Feb. 18. A Turkish force of 12,000 men, with heavy artillery, attacks the British post at Toussoum. Simultaneously another attempt is made to cross the Canal by pontoons and rafts. Our artillery and ships open fire, and after twelve hours' fighting the Turks retire with heavy losses. The British losses are two officers and 13 men killed, and 28 wounded.

5. "Warsaw at all costs," is again the Kaiser's command, and von Mackensen, with 100,000 picked men and 600 guns, is making the attempt in a desperate onslaught. It is estimated that on a six-mile front the Germans have lost about 30,000 killed. The Carpathian battle is still undecided. In the centre the Russians withdraw from two passes as part of a tactical plan, and make progress on their left and left centre. The Turks retire from the Suez Canal. Their casualties are about 3,000, including 400 killed, 600 prisoners, and 2,000 wounded.

6. A conference is held in Paris between the Chancellor of the Exchequer and the Finance Ministers of France and Russia, at which it is agreed that the three Powers shall unite their financial and military resources.

7. Operations on the Eastern front take a definite turn in favour of the Russians, who cross the Bzura.

8. The total number of British casualties to Feb. 4 is 104,000. M. Delcassé, French Foreign Minister, who is visiting this country is received by the King to-day. A Supplementary Estimate provides for an addition of 32,000 men to the British Navy, bringing the total up to 250,000.

9. The Russians are pushing through the Dukla Pass in Hungary. The enemy is completely routed in the Carpathians.

10. The German Admiralty issues an order that neutral ships shall not be interfered with if they are not suspected of carrying contraband, but that every British ship, whether a war or a merchant vessel, will be sent to the bottom of the sea.

11. In Eastern Prussia the concentration of very great German forces is established. These forces taking the offensive are rapidly developing it, especially in the directions of Wylkowsky and Lyck. The presence of vast new formations which have arrived at the front from the centre of Germany is revealed, and the Russian troops are now falling back towards the Russian frontier. In the Carpathians the Russians take the heights near Rabe, east of the Lupkow Pass, after a stubborn fight, and capture about 1,000 prisoners.

12. The German advance continues in East Prussia, the enemy pressing forward in great force along the line of the Niemen. The Russians, outnumbered by five to one, falling back on their fortified lines.

13. The new German move in East Prussia is pushed forward into Russian territory.

14. The second Russian retreat from East Prussia to the Niemen develops rapidly. The German tactics, however, are arrested. Hindenburg's hopes of following up his vigorous advance being seriously interfered with. In the Carpathians and in Western Galicia the Russians are doing well.

15. Air-raid by 40 aeroplanes (British) on the German positions on the Belgian coast. 240 bombs dropped in Ostend, Middelkerke, Ghistelles and Zeebrugge. Eighteen aeroplanes assisted by a simultaneous attack on the Ghistelles aerodrome to prevent

1915, Feb.—March.

German aeroplanes from cutting off our machines. The German advance in East Prussia and in Poland north of the Vistula continues. German columns are marching on Oswiec and have occupied Plock. The Carpathian battle is still going in favour of the Russians.

17. Germans sink a British collier and a French steamer off the French coast. The rearguard action of the Russian 10th Army during its retirement from East Prussia to the fortified line of the Niemen has evidently caused our Allies heavy losses. They escaped the attempted German encircling movement near Augustowo, but the reverse they have sustained is serious. The Germans claim that they have taken 50,000 prisoners.

18. 20th day of the war. The battle on the East Prussian frontier is not decided yet, but Germany announces the capture of 64,000 prisoners. Petrograd reports success in the Carpathians.

19. The Norwegian steamer *Beltrude* is the first victim of the "blockade," being torpedoed some 9 miles west of Dover this morning. Crew and pilot rescued. The American steamer *Evelyn*, with cotton from New York to Bremen, struck a mine to the north of Borkum and sank. A fleet of 32 British and French warships attack the forts at the mouth of the Dardanelles, silencing those on the European side and damaging those on the Asiatic side.

20. The attack on the Dardanelles forts is renewed, and two of the Asiatic forts are destroyed. The Russian counter to the German advance from East Prussia and Posen begins.

21. A German aeroplane raid on Essex towns is made. Two bombs are dropped at Brantree, one at Coggeshall, and one at Colchester. No loss of life.

22. Germans torpedo four ships off the Kentish coast. The German advance in Poland comes almost to a standstill, though fighting occurs north of Warsaw. Serious riot among Indian troops at Singapore, fomented by German agents.

23. The British South African forces operating in German S.W. Africa occupy Garub.

24. The Russian counter-attack of Mogily, south-west of Bolimow. Allied armies make a successful raid on German lines of communication in Champagne. Germany claims to hold 805,000 prisoners of war.

25. The Allies begin to dredge the Dardanelles for mines. On the Russian front a great battle is in progress from near Warsaw to Grodno.

26. Dardanelles forts attacked by the Allied fleets, the *Queen Elizabeth* taking part with crushing effect. The German attack on the Russians ends in disaster, the enemy being in full retreat from the Narew, and in East Prussia the Germans are on the defensive again.

27. Germans use burning liquid against the French trenches. The French take 2,000 yds. of German trenches in Champagne.

March 1. Great Britain declares the blockade of Germany.

2. In Poland the Germans are again thrown back to their frontier, leaving behind them over 10,000 prisoners.

3. The operations in the Dardanelles progress. British battleships enter the Straits and attack several of the forts, doing much damage.

4. The German submarine U 8 sunk off Dover by British destroyers.

5. A force of 12,000 Turks and Arabs surprise a British reconnoitring detachment in the valley of the Tigris, 180 British killed and wounded.

6. Mr. Lloyd George brings in a Bill giving the Government power to commandeer factories for munition purposes.

10. German submarine U 12 sunk to-day by H.M.S. *Arcturion*. British troops win an important battle, carrying the village of Neuve Chapelle and pressing forward to the east and south-east of the place. Over 700 prisoners were taken, and the German losses in killed and wounded number many thousands.

11. The German raider *Prinz Eitel Friedrich* puts into Norfolk, Virginia, disabled.

13. Severe counter attack on the British forces at Neuve Chapelle repulsed with very heavy loss to the

1915, March—May.

enemy, 1,720 prisoners being taken, the German losses altogether amounting to 10,000.

14. The German cruiser *Dresden* caught near Juan Fernandez by the *Glasgow*, the *Kent*, and the *Orama*. After five minutes' fighting the *Dresden* hoisted the white flag, and ultimately blew up and sank. Sir J. French reports that the German losses (March 10-13) at Neuve Chapelle were from 17,000 to 18,000.

15. An action is fought between the combined British and French squadrons and the great fortresses of the Narrows in the Dardanelles. Four of the forts were silenced, but three vessels of the Allied fleets—the *Irresistible* and the *Ocean*, of the British fleet, and the *Bouvet* of the French squadron—were sunk by mines. Practically the whole of the crew of the *Bouvet* were lost.

20. The garrison of Przemyśl make a determined but wholly unsuccessful sortie.

22. The fortress of Przemyśl falls to-day, surrendering after a siege of six months. The prisoners taken number 120,000.

25. The German submarine U 29 was sunk to-day.

26. The Austrians withdraw from the Lupkow Pass.

April 1. The British South African forces win an important success and occupy Ans, which had been strongly fortified.

5. The *Prinz Eitel Friedrich*, the last of Germany's fleet of 14 auxiliary cruisers, is interned. The Sultan of Egypt fired at.

9. The opening of the Allied offensive for the summer campaign has been favourably begun by the capture of Les Eparges. The Germans have lost 30,000 men in this region within the last two months.

11. The armed liner *Kronprinz Wilhelm* has put in at Hampton Roads, Virginia. British casualties up to this day number 139,347.

13. Strong German reinforcements are being hurried up to cope with the Russian advance in the Carpathians.

14. Fully 4,000,000 men are said to be engaged in the fighting in the Carpathians.

15. The Allies gain a brilliant success between Arras and Le Bassac. Mr. W. G. C. Gladstone, M.P., is killed at the front.

17. A Turkish torpedo boat attacks the *Manitou* transport carrying British troops in the Aegean Sea. Three torpedoes missed, but 51 lives were lost by the capsizing of a boat. The torpedo boat was chased and run ashore. The British submarine E 15 lost in attempting a difficult reconnaissance of the Kephez mine field in the Dardanelles.

19. British troops gain a notable success near Ypres, conquering Hill 60 and killing hundreds of Germans. The Russians claim to have captured at least 70,000 men in the operations in the Carpathians between March 19 and April 12.

21. The Germans continue their attempts to recapture Hill 60 without success, losing about 4,000 men within the last three days.

22. 20,000 British and French troops land near Enos. Hill 60 again attacked with heavy loss.

23. As the result of a surprise attack, in which asphyxiating gases are used, the Germans force the French to fall back to the Yser Canal, and the British supporting them are compelled to readjust their lines.

24. The Canadians show splendid gallantry in recapturing guns taken by the enemy.

25. Germans continue their attacks to the north-east of Ypres, our troops hold them in check.

27. British and French troops make good their footing on the Gallipoli peninsula. The *Leon Gavett*, French cruiser, torpedoed by an Austrian submarine, nearly 700 lives lost.

30. German aircraft drop bombs on parts of East Anglia, but do no serious damage. German long-range guns shell Dunkirk, killing 20 people.

May 1. Two German torpedo boats and one British destroyer sunk off the Dutch coast.

3. The German and Austrian forces break through the Russian line in the Carpathians, and claim to have captured 30,000 prisoners.

5. The Germans obtain a footing on Hill 60 under cover of poisonous gases.

Pears' Dictionary of Gardening

"God the first garden made."—COWLEY.

"Gardening, which inspires the purest and most refined pleasures, cannot fail to promote every good affection. The gaiety and harmony of mind it produces, inclining the spectator to communicate his satisfaction to others, and to make them as happy as he is himself, tend naturally to establish in him a habit of humanity and benevolence."—LORD KAIMES.

"Go thou, and like an executioner,
Cut off the heads of too-fast growing sprays,
That look too lofty in our commonwealth;
All must be even in our government,—
And thus employed I will go root away
The noisome weeds, that without profit suck
The soil's fertility from wholesome flowers.

We at time of year
Do wound the bark, the skin of our fruit-trees,
Lest, being over-proud in sap and blood,
With too much riches it compound itself.

Superfluous branches.
We lop away, that bearing boughs may live."
SHAKESPEARE: *Richard II.*, ii., 4.

"The soil must be renewed, which, often washed,
Loses its treasure of salubrious salts,
And disappoints the roots; the slender roots
Close interwoven where they meet the vase
Must smooth be shorn away; the sapless branch
Must fly before the knife; the withered leaf
Must be detached, and, where it strews the floor
Swept with a woman's neatness, breeding else
Contagion and disseminating death."

COWPER: *The Task*.

INTRODUCTION.

By P. ANDERSON GRAHAM, Editor of "Country Life."

THE PLEASURES OF GARDENING.

Gardening is one of the most ancient, if not the most ancient, occupations of the human race, and there never was a time when it could be pursued with more interest and profit than at the present moment. It is also an occupation open to everyone; the poorest may practise it on a small scale, and the richest may find in it wide scope for the use of capital. It is open to the possessor of a single flower-pot to grow something interesting or beautiful.

Window gardening during recent years has received the attention of the most cultivated taste, and might now almost be classed as one of the fine arts. Outside there is scarcely anything that cannot be ornamented and rendered beautiful by an outlay of time, money, and trouble in accordance with the ambition of him who exercises it. A fine old wall can be rendered still finer by growing upon it suitable plants such as wallflowers, snapdragon, foxgloves and the various lichens and mosses which he who wishes may find exhaustively enumerated by Miss Jekyll. The ugliest new wall may be changed into a thing of beauty by a judicious use of evergreens and creepers.

The gardener who is fortunate enough to have on his ground the smallest pond or the tiniest rivulet may find a delightful task in growing the various plants suitable to water. The ground itself can be made to yield effects that scarcely were thought of by our ancestors in that art.

But there are at least two very opposite sides to gardening. One is the scientific, in which the desire is not so much to produce beauty as to gratify curiosity. Of recent years hybridisation has been carried to a very high pitch of perfection, and Mendelism has been applied with such practical effect that scarcely a season passes without seeing the production of some floral novelty that is at once attractive and full of interest. And the scientists have shown what further work is possible in this direction, so that here an amateur finds a wide field for his amusement and instruction. If he is content simply to grow new and strange plants, he has but to consult the lists of those seedsmen who make a point of keeping abreast with the times, and if he goes deeper into the matter, these are days in which the portals of science are thrown wide open, so that it is extremely easy to obtain the knowledge and materials necessary to make experiments of one's own. But the scientific student is not engaged only in preparing the material out of which the beautiful gardens are finally made. Those who study effect only will not fill their gardens with novelties. They know that many of the commonest flowers—those even that approach weeds in their character, under proper treatment and management, usually by the process of massing—can be made to yield a beauty as charming as that of the most expensive orchids. One has but to look at a great mass of poppies covering a field of corn, or a breadth of speedwell rendering the corner of a field or the bank of a river azure, to see how Nature, the most skilful of all landscape gardeners, works.

The true principle of gardening is to follow her methods faithfully and truly. It would take a huge treatise to deal fully and finally with the subject, but perhaps the gardener is happiest who works out his own salvation, that is to say, who thinks of the effects he wishes, and uses his own means to produce them. The little treatise to which I have been asked to write this brief introduction will be found to contain information about the common materials required by the gardener, and simple directions about the operations appropriate to each month and season of the year. The writer has not confined himself to flowers, but has also dealt with the kitchen garden, so that those who do not aspire to go any further than the production of vegetables will find in the succeeding pages the information necessary for the task. In itself, the growing of vegetables is one of the most fascinating of all pleasures, as here, too, we find an advance and an improvement that could not have been expected a year ago. Moreover, in spite of all the modern facilities for getting fruit and vegetables to market, it may be taken as an incontrovertible fact that nothing purchased at a shop or store possesses the freshness and delicacy of taste of that which is taken direct from the soil to be put into the pot. No one can possibly appreciate what is the best in vegetables until he has learnt to grow them in his own garden.

THE GARDENER'S REMEMBRANCER.

EXPLANATORY:—*Ready reference considerations have led to the arrangement in dictionary order of the descriptive matter and cultural directions contained in the following Gardening Manual under three heads, viz:—1, Flower Culture (embracing ornamental outdoor work as well as Greenhouse and Window gardening); 2, The Kitchen Garden; and 3, Fruit Growing. It will be helpful, however, to give first a concise general*

GARDENING CALENDAR.

January.—Manuring, digging, and trenching operations should be completed in propitious weather in the kitchen garden, and flower borders made or renewed, where this has not been done before the New Year. Gravel walks may be laid down and well rolled after wet, box and other edgings mended. Rose and fruit trees may be planted still in open weather where requisite: prune old and dead wood from such of the latter as are left stationary, and have not been attended to. Bulbs may be put out yet for late blooming, those which are showing above ground being protected from frost. Prepare hot beds for asparagus and mushrooms as convenient. In gentle heat or in frames musk, single begonias, ageratum, and other seeds may be sown as well as tomatoes, and cucumbers for early cropping, and broad beans and lettuce on sunny borders; while peas for early planting out should be sown in pots, and chrysanthemum cuttings taken. Potatoes may be planted, too, in frames and dahlia roots overhauled in readiness for starting new sets. Rhubarb and sea-kale should be covered for blanching, or placed for forcing in warm unlighted sheds. Plum and other fruit trees on walls will, in many cases, be better for training, trimming, and nailing, and turfing may be advantageously undertaken now, when the ground is in proper condition. In vinerias a temperature of sixty degrees or a little over ought to be maintained during the night for vines well started, but where later grapes are the object keep the temperature lower. A good greenhouse temperature for January is forty-five degrees for hard-wooded plants like heaths, camellias, or the azalea tribe. Fuchsias may be cut down and re-potted, and cuttings taken from the new-started shoots for summer-bedding.

February.—Gooseberry bushes and strawberry beds should be manured, as also herbaceous borders, bulbs coming on in the ground being mulched lightly. Raspberries may be planted in prepared positions, shortening the canes whether they are transplanted or otherwise. Sow sweet peas and half hardy annuals of

all sorts under shelter; and cauliflower, kidney beans, and other tender vegetables in hot beds. Celery, onions and saladings should be sown in shallow pans or boxes, and parsnips on prepared beds. Tomato, cucumber, marrow, and melon seedlings coming on in heat must be thinned and transplanted, and more sowing done where wanted. Roses will repay liberal dressing with well decayed manure, but pruning even the hardest and best established should be deferred, except where the earliest possible blooming is the only desideratum, and then the risks incurred by the use of the knife before March are grave. Sow marjoram, thyme, and other pot-herb seeds towards the month end. Vines may now be forced to meet fruiting requirements and pot strawberries stimulated in growth. Plants in the greenhouse should be shifted and given a good start whenever necessary, any repotting being discriminately done. Amongst the favourite herbaceous pot plants such as cinerarias, and calceolarias, green fly needs circumventing by timely fumigation, pelargoniums should be trained and kept free from damp foliage and draughts, and everything coming into flower well watered as the camellias, which want little, care being exercised also not to wet the hearts of the primulas. Bedding plants such as cuttings of geraniums, heliotropes, petunias, and calceolarias, must now be rooted for supplying the garden borders in due season, their temporary developing quarters being systematically prepared and protected against bad weather. Dahlia tubers need excitement into steady healthy growth prior to division for cuttings being taken, and tender annuals and climbers for later outdoor planting may be carried forward a stage in cool pits or frames well sheltered from frost. Carnations, picotees, auriculas, etc., in frames can now be fully exposed when the exterior air is well above freezing point; they must, however, not be over watered, and the lights of the frames must be kept on during wet and foggy weather.

March.—Cut back and trim ornamental deciduous trees and privet and other hedges. Shrubs and bushes of all kinds, particularly such as have been transplanted, require staking, tying, and in some cases temporary shielding against high winds. Gladioli may be planted, in flowering positions for the main display, and hardy biennials placed in the borders, whilst the division and propagation of perennials must be proceeded with. Tulips, hyacinths, etc., should be

carefully guarded during frosty weather in exposed situations. Sow hardy annuals in the beds. Complete dressing round fruit bushes, and finish pruning fruit trees, protecting those showing bud in severe spells. Put in potatoes; sow main crop peas, Windsor beans, carrots and vegetables generally, and plant out cabbages, artichokes, etc., reserving cauliflowers until as late in the month as possible, and covering them against frost up as safely as can be. Mushroom beds and cucumber pits will want attention, and tomato plants coming on in bottom heat also. Growing vines should be syringed frequently, and young shoots encouraged. Most things in the greenhouse will now do with additional watering. Now is the best time for sowing in gentle heat primulas, begonias, and kindred subjects for subsequent indoor decoration, also in boxes pansies, polyanthus, etc. Pot on geranium, fuchsia, and other cuttings that are well rooted, affording increasing air after they are well established in their pots. Dahlia cuttings must be taken, the nearer the old stem the better, and planted in light, sandy compost separately in small pots, and plunged in hot beds to stimulate root development. As sunlight strengthens, the shading of glass structures in which growing stuff of almost all sorts is present will become more and more requisite to obviate flagging. In the case of young plants especially this is of more importance than the watertop, which is often over used. Water of the temperature of the air surrounding is what everything requires, be it in greenhouse, heated frame, or elsewhere, and that only when moisture is not reaching the roots with sufficiency.

April.—Lawns require mowing and rolling, and rose-pruning should be tackled discreetly, remembering that comparatively late cutting to two or three buds on a rather weak variety, and to four or five buds on the stronger sorts, eliminating all weakly growth, is likelier to produce more satisfactory results than the too early and yet timorous handling of the knife. The harder hybrid perpetual and bush roses should first be dealt with, standards next, and wall and arched roses generally last, all these being pruned less drastically. In every case the soil should be well stirred round the roots, and the nutritive mulching applied, all briar suckers being removed. Keep the hoe going on all permanent borders to prevent weed growth, and plant out shrubs that have been wintered under shelter, gradually withdrawing protection from the tenderer species which have stood in the open, forking and raking intervening ground. Stocks, carnations, hollyhocks, pansies, bedding calceolarias, and the like, may be transplanted in suitable weather, affording slight cover against sun by day and possible night frosts, until a start has been made, besides circumventing the slug. Afford budding auriculas, polyanthus, hyacinths, and tulips attention, guarding against heavy rain; sow more seed of annuals in the borders thinly, and prepare beds for their transplantation. Potato planting may continue in the kitchen garden, as well as the pricking out of cabbages and greens, celery and cauliflowers. Sow vegetables for autumnal handling, such as beet and turnips; also beans and peas, spinach, lettuce, radishes, etc., for succession. Protect pea rows and springing broad beans by earthing up, and look to the asparagus beds, sowing seed of the latter. Seed of runner and dwarf kidney beans must also be got in, and well-grown lettuces need tying. Where possible protect the blossoms of the finer fruit trees with light tiffany or herring nets. Give vine borders the requisite dressing, and ventilate the vinery with care, maintaining a suitably high temperature after the thinning of bunches has been accomplished. Greenhouse plants must be kept clean by the removal of dead leaves and superfluous growth, and the prevention of moss formation on the surface soil, while the propagation of tender subjects from cuttings and offshoots should engage attention. Fern spores may be sown in bottom heat, and young ferns and musk potted off.

May.—This is the month in the flower-garden for finishing the furnishing of borders for summer display and clearing off the bulbs now over the blooming, which have supplied the ground in many instances hitherto. Taste and care should be shown in the operation in order to secure the most pleasing effect,

and plenty of room allowed for development. The most delicate species should be kept in shelter until frost risks are past, so that no stoppage succeeds the planting. Select a favourable relative position for every plant, spread out the roots nicely, and press firmly, shade and water, and keep the snails and slugs away, replacing failures from reserve. Thin out growing annuals and other seedlings to prevent crowding; pair down petunias, verbena and trailing geraniums as they extend; stick fuchsias, zonal pelargoniums, carnations, and everything requiring support. Syringe the aphides off the roses, and from standards rub away growth buds on the briar stock as soon as they show, tying back growing shoots on the wall varieties to obviate injury. Judicious thinning of wall and tree fruit will be repaid; pick off caterpillars from currant and gooseberry trees as they appear. Sow saladings, parsley, etc., and prepare outdoor marrow and ridge-cucumber beds: sow runner beans in rows for regular cropping, and continue slightly to earth-up peas that are getting forward. Transplant cabbages, thin parsnips, carrots, and onions. Cucumber frames should be carefully ventilated, damping the soil and woodwork lightly before closing in the early evening, and pinch the trailing shoots back to within three leaves of a formed fruit. Conservatories, greenhouses, and frames are undergoing great clearance for bedding out and placing of pot plants on ornamental stands, as well as the filling of window boxes, vases and hanging baskets; opportunity should be taken to overhaul the larger specimen plants in the houses, trimming and re-potting where necessary, and training up roof and pillar climbers, applying a top dressing of soil where shifting is not wanted. Pot on young stuff to fill the staging. Thinning and stopping of lateral shoots in the vinery for the later grapes, and feeding for those with ripening fruit, will be requisite.

June.—Watch the filling out of the bedding plants according to design in the borders, trimming edgings and rows neatly and keeping creepers within bounds. Stake stems wherever the need is evident, stirring the ground and watering well when the sun is hot up, to aid growth and flower formation. Seeds may be sown of calceolarias and other plants for next year's flowering. Establish outdoor tomatoes in sunny positions. Look after the marrows and re-spawn mushroom beds. Thin out seedling vegetables and eradicate weeds by hand and hoe, transplanting cabbage and other culinary greens on moist days as requisite. Disbud young growing vines, encouraging only a sufficiency of the likeliest shoots. Pot herbs should be cut and dried on attaining maturity. Where azaleas, heaths, epacris and camellias are being brought on in the greenhouse, moist heat should prevail to encourage growth, prior to turning the plants into the open to harden for winter blooming. Gloxinias, achimenes, etc., should have shade and plentiful watering as the flowering period approaches; balsams must be shifted as rapidly as possible. Train standard fuchsias neatly, keeping the budding sprays to the light. Pot chrysanthemums for blooming, and place them in the open when the roots have gained good hold. Pelargoniums, show and fancy, as they finish blooming, are to be placed, if possible, in cool, well-aired frames for hardening their shoots, the best cuttings being used for rooting.

July.—Rose-budding is most successfully accomplished this month. Pillar roses and climbers generally require training, tying, and thinning, while plentiful syringing will be helpful where green fly gives trouble. Secure dahlia shoots against wind, and trap earwigs before they can work damage. Feed chrysanthemums and remove side-shoots and tops of the tallest. Pinks may be divided as soon as flowering ceases, carnations layered, and verbenas cuttings may be struck under glass. The various tuberous anemones, ranunculuses, and the like may be taken up and kept for autumnal replanting. Water everything in the border copiously in dry weather, and keep all in trim. Wireworms will do much mischief among carnations if not caught in pieces of potato inserted below the soil surface. Campanulas and other biennials and perennials may be sown and flower seeds gathered from the garden as they ripen. Grass lawns and edgings call yet for great care, and weeds must be kept off the

paths. Strong-growing bedding stuff and spreading herbaceous plants have to be cleared. Vacant places in the kitchen garden need preparation for the reception of winter maturing vegetables, and bearing beans and peas will yield the better for liberal supplies of weak manure well soaked in. Parsley should be thinned out, and lettuce transplanted; turnips may be sown where new potatoes have been dug. Full-grown cabbages may be taken up, and vegetables generally gathered as soon as they are ready. Much raspberries and secure strong strawberry runners when fruiting is over to form new plantations. Cucumber plants in frames and marrows out of doors should be watered freely, and tomatoes trained and stopped systematically. Shading will be requisite in all vineries where grapes are ripe, to prevent shrivelling, and fig trees may be advantageously pruned now. It is difficult in July to over-ventilate an ordinary greenhouse. Cape leaths report now safely, should the shift be needed. Calceolarias may be sown.

August.—Watering and weeding is almost a daily duty in the flower garden, and surface dressings may be renewed round choice roses. Evergreens need pruning to prevent overgrowth, and thirt edgings should be trimmed. Keep the seed pots picked off, for annuals to prolong the blooming period, particularly in the case of the sweet pea family. Gross growth in dahlias must be checked. Layering of carnations and picotees will still succeed if a good compost be employed; layers already rooted should be lifted and potted off. Cuttings of bedding plants that are likely to be wanted should be taken now. Rose cuttings may be struck in light soil over a mild hot bed, potted up and hardened gradually. Pinks, pansies and large double wallflower cuttings recently rooted, may be placed in the open to stand the winter. London Pride and other saxifrages are propagated by the removal of offshoots in August with ease. The bass binding should be loosened on budded rose stocks. Lime is effectually employed in the kitchen garden to lessen the ravages of snails, and caterpillars must be hunted and destroyed grovays and the rest of the cabbage kind, while pea and bean haulm requires clearance as cropping concludes. Well water runner beans at the roots, make a final sowing of endive to stand winter and get out the last of the transplanted celery. Ventilate vineries, and stop young canes when they reach the top of the house. Dust with flowers of sulphur any chrysanthemums which are showing signs of mildew, giving manure water liberally. Seeding auriculas, calceolarias and cinerarias may be potted when ready; and half hardy annuals like nemophila, rhodanthé, and collinsia sown in pots for winter flowering. The tenderer pot plants removed from the greenhouse for summer exposure ought to be taken in again by the month end, particularly when there is continuous rain. Hoe and rake shrubby borders. The selection and training of young shoots for next year's yield should be seen to in the orchard as the various fruit trees complete the season's growth.

September.—Falling leaves give a lot of work on lawns and flower beds now. Clear all up daily, and give unremitting attention to plants blooming in the borders to obviate overlapping and rank luxuriance. Dahlias should be tied in, and the shoots cut away. Late in the month put out bulbs for spring display, hyacinths and the like being placed simultaneously in pots and glasses for window decoration, varieties of the narcissus tribe being similarly treated. Earthing-up celery may be proceeded with, potatoes dug, and arrangements for the winter and spring cropping of the vegetable ground carefully completed. Lift onions, drying them well in the sun, and gather tomatoes; transplant lettuces into frames for winter cutting, and thin spinach. Apples for keeping should be allowed to hang as long as possible, and be laid carefully away in a dry storing place. Borders may now be made ready for planting young fruit trees, and strawberry beds for the ensuing main crop should be filled with healthy young plants. Damp mounds should be avoided in the vine where late grapes are ripening, and firing attended to. Early vines, pot or planted out, will want proper pruning. Cucumbers and melons still bearing in the pits need air by day more than

moisture now, and mildew is a danger to be overcome by cautious watering in this respect and by the timely application of sulphur over the leaves. Before the greenhouse is filled for the winter is a good time for a repainting, which should be quickly and efficiently done on dry days. From outdoors and the cold pits the hestha, azaleas, camellias, and the rest of the plants for winter growth and blooming can then be stood in the best positions to remain. Pelargoniums cut down after flowering and re-establish for specimens, as also fuchsias, well hardened, will also come in to keep dry for the winter. The propagation of half-hardy plants by cuttings should be completed, frames as well as the warmest spots in the underpart of greenhouses and conservatories being fully utilised for the purpose. Striking having been accomplished on bottom heat, the cuttings will come on safely in a temperature of fifty degrees or so, which should not be exceeded in the greenhouse in autumn and early winter. Watering must be moderate, and ventilation free, so long as frost is never allowed access to the houses.

October.—From the summer flower-beds everything that has had its day having been removed, the time has come for substituting hardier species. After the clean sweep there must be a thorough sowing and sowing, and then wallflowers and many useful biennials and perennials, brought on for the purpose, are to be planted in the places of the summer occupants of the borders, the taller growing things farthest from the front. Polyanthus, violets, narcissus, primroses, pansies, well-divided rockets, lychins, and bordering of arabis, alyssum or other suitable frost-resisting, low-growing plants can now be put into position, spring blooming bulbs being interspersed according to fancy. There is endless variety attainable at small cost and easy of cultivation. Permanent borders may now be dug, and all the dead wood from shrubs cut away. Take up dahlia and begonia tubers as well as gladioli corns, and put them by, well dried, for the winter rest. Transplant ornamental deciduous trees and flowering shrubs. Chrysanthemums in pots must be taken to their blooming quarters before the frost can injure them, and some of the choicest pansies as well as all calceolarias worth keeping put into unheated frames for protection. Prepare tulip beds for massing effect, using a good depth of light fibrous loam to receive the bulbs. Primulas and cyclamens should be kept warm in pits preparatory for removal to greenhouse or conservatory shelves for flowering when bloom is scarce; and stocks, mignonette and many other things wanted in spring can be accommodated similarly. See that every plant in the greenhouse is clear of green fly, scale or other pests, and keep all kinds of succulent plants free from excessive water. All established vines which have finished fruiting may now be thoroughly pruned, if the wood is ripened hard, and a good general cleaning of the canes, by the removal of loose bark, is desirable, coincidentally with a dressing of the borders as requisite. In the kitchen garden late planted cabbages, brocoli, turnips, etc., should be well hoed. Young lettuces and cauliflowers may be planted on sunny borders, and pot herbs put in convenient places. The last of the potatoes having been lifted, and beet, carrots, parsnips, etc., safely stored, the ground should be well dug, trenched and manured. New fruit trees may be planted, and old ones where necessary rootpruned to keep down gross and unproductive growth.

November.—Edgings of all kinds in the flower gardens need trimming up well, and new ones of box can be planted at the beginning of the month. Digging and manuring, wherever fork or spade can be got to work, is essential, and opportunity should be taken to amalgamate with the soil in the process as much manure as is required. Lawns should be cleaned up and well rolled when the last fallen leaves have been swept away, and then left till the grass begins fresh growth. This is the best time to transplant most roses; their roots should be carefully spread in prepared ground, and pressed into a good compost, a surface dressing being given to complete the work. The tenderer tea and climbing varieties, where exposed, may advantageously receive protection against frosts to come. Liliums should be planted in the first week of the month, also the early flowering gladioli in pots. Phloxes divide and move

now. In the general clear up in the flower garden all stalks of stationary herbaceous plants should be cut away and burnt, with the rest of the accumulated rubbish and dead leaves carefully collected for rotting to mix in due course with potting compost. Prune gooseberry and currant bushes, also prune and nail wall fruit trees, and thin the larger orchard varieties judiciously, replanting and manuring as necessary. Rhubarb must be covered with litter, also endive and sea-kale, and celery may be finally earthed up and protected. A soot dressing should be scattered about cauliflower and cabbage plants. Hot beds should be renewed where exhausted, and fresh mushroom spawn placed in prepared beds for winter yield. Radishes, lettuces, and small salad stuff can be grown in frames, to come in handy before those produced out of doors are ready. Young vines may be started in bottom heat in pits, or over the flues in the vinery, which is usually utilised for the wintering of plants that do well there without injury to the grapevines overhead. In the conservatory there should now begin to be a good show, the chrysanthemums, geraniums, primulas, etc., affording the colour staple, while ferns, begonias, palms, and other ornamental plants combine to form an agreeable and easily varied decorative arrangement. The Roman hyacinths, early started, and some of the powerfully scented giant mignonettes are also among the flowering plants available for the end of the year in glass structures. The temperature ought to be equally maintained, overheating being guarded against quite as much as cold draughts. Remove all dead leaves and loose dirt to keep the air sweet and clean.

December.—Everything liable to injury by severe frost in the garden should receive some slight protection during its prevalence, and cocoanut fibre may be strewn upon bulb beds. Sweep snow from lawns, shake it from conifers, and roll grass when not too

frosty. Gravel or other walks ought to be kept tidy. Turning may be done early in December; good soda, firm flat fixture, and frequent rolling thereafter are essentials of success. Following severe frosts, it is well to press carnations and pinks firmly into the earth, and pansies may be treated likewise. Manure watering may be applied advantageously to borders, which have previously been well forked, either between growing plants, or where vacant entirely for the time being. It is a good plan to be active with the spade and fork in the garden in the winter, without disturbing the vegetation, dormant or otherwise. Any alterations, such as making fresh paths, or laying out new beds, can now be carried out. Nothing is worse than leaving the garden to look after itself all through the cold months. Horticulture must be systematic and practically ceaseless. In dry weather trenching and manuring may be pursued in the kitchen garden, and early-sown peas and beans peeping through should have the loose earth gently drawn up on each side of the rows for protection. A light covering of litter will be helpful to strawberry beds in frost. Give air cautiously during severe spells to pits and frames, and cover those containing delicate things with mats at night. Keep cinerarias and calceolarias near the glass, and water carefully as requisite when the flowers are coming out. Auriculas in frames, also carnations stood on ashes, should be kept cool and dry. Damp the early vinery floor on bright days as branching proceeds, and keep an eye on the outside border to see that the vine roots are practically as warm from the fermentation of material employed outside as is the foliage within the structure. Keep the greenhouse dry, and not too warm. Plants wanted for earliest flowering should be placed nearest the glass. Fancy pelargoniums and other subjects liable to harbour green fly must be watched and cleansed on the first appearance of the pest.

FLOWER CULTURE

(Embracing Window-gardening and Greenhouse Work)

Abelia.—*Abelia rupestris* is a useful deciduous shrub, reaching a height of 3 feet, and bearing in early autumn clusters of fragrant white bloom. Plant in a sheltered sunny position, in good light soil.

Abronia Umbellata.—Rosy-lilac, half hardy annual, 6 inches.

Abutilon.—Free-growing, hard-wooded greenhouse shrub, bearing pretty and distinctly formed flowers, some varieties having variegated foliage. Useful for training round pillars as an indoor pot-plant, and for plunging in a sheltered spot in the garden at the back of a bed in summer time. Sow in bottom heat in spring, and transplant into rich soil, or strike in September, potting off into good-sized pots.

Aconite.—The yellow mimosa makes a good greenhouse or window plant, and is easily cultivated. The Locust tree is really not a true aconite, but is a favourite for planting in ornamental shrubberies, and sheltered front gardens, where it will rapidly grow to a great height, though taking many years to mature. Bears sweet-scented blossom in June, and has particularly graceful foliage.

Acanthus.—Beautiful leaved South European herbaceous perennial, grows and flowers well in light border soil. Raised from seed or propagated by division. Commonly called "Bear's breech."

Achimenes.—Raised from seed in a hot-bed in shallow well-drained pots, these pretty plants bloom well in a warm greenhouse or conservatory, and do nicely in decorative hanging baskets. Leaf soil, rich loam, and silver sand, with a few lumps of charcoal over the drainage, should be employed, and they should be kept moist at the roots when growing and flowering.

Aconitum.—The blue monk's-hood is often grown at the back of borders or in front of shrubberies, where it gives little trouble. There are white and purple sorts, less common, but also pretty. The winter aconite,

yellow flowered, is popularly called "The New Year's 'fl'" because of its early blooming. It will grow in any corner almost, and gives no trouble. Seed of all the aconites may be sown in summer, and the young plants should be kept well-watered, and removed to their permanent quarters in the following year, or propagation by root division, as with many other perennials, is safe and easy.

Agapanthus.—August-flowering African lily, for pot culture or massing in beds, in the summer with gladioli; the blue or white varieties are very effective. Must be kept dry in winter, and if left out of doors protected from frost. Thrives in strong loam, not too rich, and does well in large pots or tubs. Well water with liquid manure in warm weather.

Agave.—The American aloe is the most generally cultivated of the agaves, and will stand in a big pot or vase on a terrace for many years. Whatever the agave is grown in should be well-drained, and the compost be fibrous loam, and coarse sand, with some old mortar, the whole firmly rammed down. Top dressing under the thick, fleshy, thorny-edged leaves may be applied occasionally with advantage. Heavy watering is helpful in summer, and any suckers thrown out may be potted off. Specimens planted out in favourable situations will reach 15 feet high or more. The plant dies after flowering.

Ageratum.—Dwarf, half hardy annual, bearing grey, blue, white, or rosy blossom, the former being oftenest met with. A useful bedder, easily raised from seed in gentle heat in March, or may be sown in a sheltered position outdoors later, and transplanted before placing in the border. Succeeds best in good light soil. Introduced from Mexico, and deservedly a favourite.

Aloxon Warcewiczii.—Bright, scarlet-blossomed half hardy annual, 1½ feet, prolific and useful for cutting.

Alyssum.—(See *Lemon Plant*.)

Alpine Plants.—The arbutus, gentians, and numerous other hardy favourites of the rock-garden and permanent border, indigenous to mountainous districts, come under this category. Most can be raised without difficulty from seed and started in small pots with a strong loamy compost containing sharp sand and grit, while some are also propagated by division. As a general rule, the climate of alpine, hardy, like those when well established, so that it is important to place them properly in the first instance, leaving room for natural development, and relying on seedlings for renewal or increasing stock. Good drainage is an essential of successful pot culture.

Alatrionia.—A showy, tuberous-rooted perennial, suitable for border cultivation, and needing protection in severe weather, with good soil to luxuriate in. Can be raised from spring-grown seed, and needs well watering in summer. Flowers, a mixture of yellow, orange, and intervening shades to flaming scarlet.

Alyssum.—Hardy, compact-growing border or rockery perennial, useful for edging purposes, 6 inches to a foot high. The variety saxatile is a very early golden-yellow flowering subject, and argenteum has beautiful silvery foliage. Seed should be sown in May to produce plants for following season's blooming, or cuttings can be put in a cold frame to start at the same period. The rock madwort, as the perennial alyssum is called, flourishes in sunny town borders. The "sweet alyssum" is a prolific British annual, which may be sown out of doors in April where wanted to bloom. It is white flowered.

Amaranthus.—Useful and distinctive annual, 2 feet high. Caudatus (the well-known Love-les-bleeding) and Hypochondriacus (Prince's Feather) are very useful for borders.

Amaryllis.—This bulbous-rooted plant may be given pot-culture in a greenhouse, being placed in deep pots as near the glass as possible, or out of doors, under a south wall in good, rich, peaty loam, mixed with matured stable manure. It reaches a feet high when at perfection, and bears gay, lily-like bloom, "her of white ground with rosy-purple flushing (as the *aviladonna* lily) all white (as *Longifolia alba*), or crimson (as *Formosissima*). There are other varieties, including *Lutea*, which is yellow, and *fers* in autumn. They should be plunged in 6 inches deep for outdoor culture and protected in winter; while the bulbs for pot growth must be planted up to the neck, and are best started in heat in spring. Whilst leaf formation proceeds, water freely.

Anemone.—The well-known "wind-flower" is difficult to surpass as a spring-blooming perennial, hardy and brilliant. The tubers should be planted in late autumn, when most kinds will flower in May. There are many beautiful colours and both single and double varieties, the latter later in blooming than the former. They prefer friable soil and a position free from keen wind, and will do well for years where well established, though some authorities advocate replanting after three or four seasons to avoid soil exhaustion and consequent deterioration of bloom. Lifting the mass with a fork and enrichment of the ground under the stool and around will suffice to sustain the choicest anemones at their best, if good rotten manure and sharp sand be plentifully employed. Many varieties will flower in mid-winter weather, and the scarlet fulgens is generally very early. The summer and autumn blooming *Anemone japonica* is very hardy, and its long flower stalks and cup-shaped white blossoms are always admired. The poppy-flowered French sorts are easy to deal with, and many of the singles which cannot at any stage endure frost. All are raised from seed, and their culture generally is dealt with in due course under that head later on. It

is sufficient to state here that the amateur who proceeds with care and discrimination, though he does not own a greenhouse or even a frame, can succeed in cultivating, if he takes the precaution of procuring good seed and attending closely to the directions, an immense variety of beautiful annuals, half hardy and tender. But he must approach the task with circumspection and systematically, using his wits as well as his hands, and not buying a lot of packets and emptying them out over borders or into boxes in patches, leaving Nature to do the rest. The growing of annuals of all kinds from seeds germinated in one's own garden is much more satisfactory than the purchase of plants raised in a nursery, though there is an added amount of trouble entailed. Also the former plan can be pursued with economy; whereas let each home gardener seek to have all the glory of providing his own display of annuals, and profit pleasantly by his practice. This dictionary, diligence, the instructions given on the smallest packets nowadays by reputable seedsmen, and experience together, will enable anyone with a real love for flowers to make a grand show almost all the year round, in a garden of modest dimensions, at a very small outlay, out of annuals alone. All the most desirable varieties will be found entered in the alphabetical order of their names here.

Antirrhinum.—The snapdragon is an old garden favourite, and a useful perennial that can put up with poor soil, especially if it be at all chalky. The more vigorous type of antirrhinum grows well upon rockeries and even on old walls; but good soil tends to perfection with the choicer varieties which floricultural selection has produced. Many fine-flowered sorts are now obtainable from seed, as also striped, veined, and marbled sorts of great beauty. By sowing in heat early in February, all snapdragons may be treated as annuals, transplanting into sheltered situations in good soil, to be moved to their permanent positions in May, when they will bloom in early autumn. After the flowering, cuttings may be taken, and will root easily in cold, close frames. The old plants may be cut down and returned for early summer flowering. A sowing of this favourite perennial may also take place out of doors in June, and transplantation to blooming beds in September, when the flowering will commence early the season following. They are very hardy, and resist drought, but should be moved on moist days.

Aquilegia. (See *Columbine*.)

Arceuthia.—A Chilean cone-bearing tree of a peculiar, yet highly ornamental character, with stiff, straight branches, almost at right angles from the stem, covered with pointed leaves, the variety most usually found out of doors in this country being imbricata, the "monkey-puzzle." Likes open situations, and will carry snow without injury, but is sometimes browned by severe frost. Not easily moved after establishment, but will stand for many years on lawns or in parks after it is established.

Arbutus.—A beautiful flowering and fruiting shrub, sometimes called the strawberry tree. Its clustered, cup-shaped blossoms are followed by deep orange or red strawberry-like fruits. Can be raised from seed or by layering, and flourishes near the coast in warm situations, growing best in peaty loam. It will reach ten feet high under favourable conditions. Smaller specimens of certain kinds of arbutus are grown in cold greenhouses for decorative effect.

Aristolochia Sipho. the "Dutchman's Pipe."—An ornamental climber with large leaves and peculiar shaped flowers; thrives as a greenhouse and sheltered out-door pillar plant when grown in good peaty loam, with a mixture of clean, sharp sand. Propagated by root divisions and spring or autumnal layering.

Aspidistra.—An easily cultivated plant, sometimes called *Richardia* and *Calla*, and more popularly the trumpet or Nile lily. Grows freely from offsets, and requires protection from frost only. Should be re-potted in October in good light soil, having rested in a dry place after finishing blooming in June; but in the growing state cannot have too much water if the soil is well drained. Its beautiful flowers are most distinctive, and attract the eye. One of the best of room-plants, not affected by gas fumes. Will keep in health for years in ordinary soil if nicely drained, sparingly watered,

and occasionally sponged. Bears small and insignificant flowers close to the soil, and is increased from suckers.

Aster.—Indispensable garden flower. Very varied in height, form, and flower shape, as well as coloration. The old China aster *sinensis*, 15 inches, has white, red, and blue shades, self or suffused. Then there are the giant comet varieties with very large flowers, the pretty dwarfs that keep down to 2 or 3 inches, the pom-pom-flowered type, the quilled German sorts, the flat French varieties, incurved, and others. Any of these can be grouped effectively in beds, and answer the demand for cut flowers admirably. They are treated as half-hardy annuals, sown in March in boxes or pans of light rich sandy soil under glass, in an airy sunny situation, transplanted later in a sheltered yet uncovered place to spread their roots and become sturdy, and bedded out in due course or potted off towards the end of May. They will stand watering with weak manure as the flowers begin to show, and top dressing is serviceable. The true aster is the Michaelmas daisy, a very useful border perennial of quite another character.

Aubretia.—A good border plant, or rock triller, with purple bloom and evergreen leaves. Perennial, 4 inches in height, grows best in sandy soil, flowers profusely in spring, with many sunny spots, and is easily increased by division of the roots.

Aucuba.—The familiar variegated laurel of the shrubbery and town garden, which resists smoke and will grow in any nutritive mould. Cuttings will strike in light soil readily in spring or autumn.

Auricula.—Alpine and show auriculas are distinct, the former being very hardy, the latter requiring to be cultured by division in autumn or from seed sown in spring under glass in sandy soil. Grown in pots, which should be small, auriculas must be given plentiful drainage, and require a sprinkling of powdered charcoal or wood ashes in the compost. They do best shaded from strong sunlight, and should be top-dressed with well-sifted manure or leaf-soil in February, and in watering care should be taken not to wet the flower buds or leaves. The eye of the blossoms of the Alpines is yellow, with gradations of varied rich colour deepening to the edge. The show sorts are either solid, green-edged, grey-edged, or white-edged, the more clearly defined the outer zone of the three last classes the better. The show varieties are particularly susceptible to damage by damp, and should not stand on the ground, but upon a bed of ashes if in a frame, or on shelf in the greenhouse. There are many splendid varieties.

Azalea.—There are outdoor and greenhouse azaleas, both beautiful, the latter excessively so when in bloom. The hardier varieties of the garden do nicely in sheltered permanent situations when grown in a compost of well-sanded peat and loam, soil which suits the pot sorts, also whether of the Indian or Chinese description, if charcoal be employed liberally over the crocks forming the drainage. Together these should occupy quite a third of the pot, and the charcoal may be advantageously steeped in liquid manure before being used. As in midsummer the plants should be taken out of the greenhouse and placed in open frames or under sunny walls to make new growth, which must be well ripened by the autumn. Watering with weak manured liquid during development is requisite, and strong sunshine hardens and ripens the new wood. Before bringing the plants into the greenhouse or conservatory in October they should be neatly tied and trained, the budding shoots being turned outwards, and a good cleaning and top-dressing given to every specimen, all traces of thrip being removed by dipping once or twice in tobacco water. Azaleas make splendid parlour window plants when the blooming period arrives. To get equal flower furnishing, besides discriminate tying of the shoots to nicely arranged stakes, it is better to train the plants round occasionally, thus obtaining equality of exposure to light. Efficient drainage and copious watering, when the azaleas are dry only, will ensure success. The reward of cultural care will be floral beauty of several weeks' duration. Plants of very large size can be secured by occasional shifts to larger pots at the

proper repotting period, specimens lasting for many years when treated as here directed. They like light and air.

Balsam.—Decorative, half-hardy, prolific-blossom annuals, very useful in conservatories or greenhouses or outdoors in summer, also for window show. They require rich soil to be grown to the best advantage, and stimulation to rapid growth from the seed bed onwards. Sow in early spring, in heat first, and in cool frames later, bringing on the young plants by shifts to larger pots, plunged in tan or fibre as required, watering with weak manure freely. For blooming seven or eight-inch pots are the best size, and for bedding-out the plants should be carefully removed without breaking the ball, just releasing the root ends and well watering to prevent check. They need staking nicely, being easily broken, both as to stem and shoot, and protection against heavy wet should be arranged where possible for outdoor balsam beds, as the diversified and beautiful blossom is very delicate. Colours range from pure white to vivid scarlet and rich purple, with many spotted and splashed flowers, which contrast prettily with the light green of the foliage and translucent stalks. The so-called "camellia-flowered" balsams are of gorgeous presentment. Their production is only a matter of cost and attention, and as feasible for outdoor culture as for indoor display.

Bartonia aurea.—Favourite bright yellow annual, fifteen inches high.

Bear's Breech.—See *Acanthus*.

Bedding Plants.—The plants for summer flower-ing display in outdoor beds and borders, arranged in masses or lines of colour contrast to produce effect, are chiefly of a nature so delicate for development in the open and have had consequently to be brought on under shelter, ready for placing in parterres when the last frost risk is past. In our treacherous climate it is highly important that premature planting should not be adventured upon. Better a little late than over early. Sunny May days are deceptive, and sometimes require supplementation of a wing night breeze, or a nipping wind. The great thing to do is to gradually accustom the subjects to the change. Take them out of the houses and frames, or having brought them from nursery or market, stand them in the open to harden before placing in the beds, giving protection against strong sun and excessive cold. Then have the borders well prepared, and the soil in good condition for the reception of the summer occupants, and your plan of arrangement well and wisely considered beforehand, letting example and experience be your guides. Watch the work of the gardeners in the parks, and gain the benefit of their knowledge. Place each plant out carefully, selecting dull, warm days, when rain may be looked for, if possible, for the operation. Spread out the roots well, and without inflicting injury, press in very firmly, the crown of the ball just below the bed surface to allow a slight hollow for preventing water running away before it begins to travel root-wards; give a thorough good soaking to settle the soil round, and should powerful sun follow the planting before the removed subjects are established in their new quarters, help them with temporary shade. A good start and no stopping thereafter will be the object to be aimed at. Only so can satisfaction ensue. Mid May is soon enough to begin bedding anywhere in Britain, speaking generally, and the beginning of June is safer, though the weather prevailing at the period must be the final consideration. The hardier bedders, such as shrubby calceolarias, well prepared, can go out first, with young and the bigger stuff of the biennial and perennial bedders be pressed into service, such as *selago*, *napaeus*, *delphiniums*, and the like, and *crasium* for the outer edging where desirable. Do not have the bedding mould too rich, but good, sweet, clean, and friable. Then in with the geraniums, lobelias, heliotropes, verbenas, petunias, ageratums, mimulus, salviae, echinops, or other succulents, begonias, perillas, pyrethrums, and what not, with a true eye for flower and foliage colour harmony and remembrance for height the subjects are likely to attain, the taller to the back. Put your dahlias to the back of all, and give them and everything else plenty of room. Do not crowd, or you will have weaklings soaring skywards or

willing to the ground. Arrange for supports to sweet peas, tropaeolum, and all climbing things you utilise. Give sticks to fuchsias and balsams that need it; and as the need arises later, peg down peonias, verbenas, heliotropes and lily-leaved geraniums, to permit of expansion and new shoot-breaking. Then watch and wait, and water when necessary only. Use the hoe freely to stir the surface soil, without disturbing the roots, and put in a stick here and there gently there, and all will soon be in going order. If you drop in a pot rose or lilium to make a break, see that the wind does not injure them, and everywhere aim at emulating Nature, and leaving her "ample room and verge enough." You'll be all right then, with little trouble, till early autumnal frosts call you to clear the summer beds and make way for winter. That's the whole art of bedding.

Begonia.—Flowering begonias, admirably adapted for bedding, greenhouse, and window decoration, as well as the metallic-looking, silver-belted, hairy-leaved sorts that furnish such distinctive ornamentation indoors, are tuberous or fibrous-rooted plants of much attractiveness. The large-leaved sorts can be propagated from leaves laid on good silver-sanded soil over bottom heat, the ribs and veins being slightly incised underneath with a sharp knife; but all kinds increase easily by root division, or can be raised from seed. There are many varieties and hybrids, compact and branching, large and small flowered, in numerous shapes and shades. Indoors they like warmth, moisture and shade, outdoors they should be well mulched and kept damp at the roots. They require light, yet specially rich soil and careful staking in most cases, the branching growths being very fragile. In the growing period forcing is advisable, with airy surroundings at the flowering time. Good seed, and dry tubers are obtainable of all the best sorts from the leading nurserymen, and young plants must be carefully slayed and potted on. They must be well watered in dry weather.

Belladonna Lily. (See *Amaryllis*.)

Biennials and Perennials.—Sweet Williams, Stocks, Canterbury Bells, Fox-gloves, French Honey-suckle, Honesty, and other indispensable garden flowers come under the heading of biennials. Most of them by early sowing made to flower the same year, and preserved after the biennial or fully mature period of flowering has finished by layering down branches or transferring base shoots. The carnations, saxifrages, and the like hardy garden favourites which preserve their leaves, and the multitudinous herbaceous border plants that die down annually to re-appear the succeeding season come under the perennial category, and all the chief sorts are noticed specifically in their order in this dictionary, and seeds and propagating instructions given in due course.

Borders.—Both for bedding plants and permanently placed herbaceous subjects of the perennial order, borders should be kept in good cultural condition by forking, cleaning, manuring, and general overhauling in due season, in exhaustion of the soil should supervene. Heavy ground requires breaking, old stools systematically dividing; light soil needs enrichment. Bulbous plants are generally gross feeders and quickly impoverish a border, so do wall-flowers and other strong growing things. Always use thoroughly decomposed manure, and fork in the dressing to mix evenly with the old mould. Let sun, rain, and air have free play, and do not be afraid of deep digging when you are at it.

Bouvardia.—Shrubby and serviceable greenhouse plants, with white, scarlet, and other coloured flowers, scented, raised by spring striking of root and stem cuttings.

Box.—The dwarf evergreen is chiefly in vogue for edging purposes, for which it is very handy, though it sometimes proves a harbour for slugs. The variety sempervirens is the best for finishing off borders, and should be planted in spring or autumn, and kept in neat trim at all times. There are variegated kinds of *Buxus*, *aurea* and *argentea* among them, useful for ornamentation.

Bones, Window. (See *Window Gardes*.)

Broom. (See *Broom*.)

Brisa.—Ornamental grasses, useful for bouquet-

making, and in floral decorative work generally. The family includes the "trembling" or "quaking" grass, the "ladies' tresses," and others. All may be grown in sunny patches from seed sown in March.

Broom-pot. *Broom-pot.*—These are very valuable garden biennials flowering well when flowers are scarce, and there is great variety of colour procurable, white, purple, violet, and many shades of red. They do nicely in good soil in pots, and can be put in cold frames over frost time, when they need protection; whilst those growing in open borders may be lifted carefully and replanted temporarily in sunny shelter till springtime, and then replaced where they are wanted to bloom. (See *Stocks*.)

Bulbs.—There are bulbs and bulbs, and bulbs—so-called—which are not bulbs at all. The hyacinth tribe, growing coat over coat, furnishes one class of true bulb; the lilies, scale over scale, another. Snow-drops and daffodils belong to the first group, and there are many lilaceous subjects. But crocuses and gladioli, and even more so the cyclamens, are only bulbs in external appearance. It is convenient to call the gladioli root-crown a corm, but when further away from bulb-land's centre, we come to arums, asphodels, lilies of the valley, flame flowers, ranunculi, anemones, irises, and pæonies—which some folk will insist on including in the category—we call a bulb, and discriminate between tuber, root, and bulb. There is no need, however, to be too pedantic here, for each subject has its due paragraph. Most bulbs for garden growing should be deep planted, in good soil, to keep them clear of frost influence, in well-drained borders free from tendency to waterlogging. They should be left alone after blooming until every leaf is quite dead, when they may be taken up and stored in the dry for the next planting, or allowed to remain in the natural course, when, if injury in digging be avoided, surprisingly good results will follow. The remark applies specially to the liliaceae, and such tuberous perennials as the iris and its allies. These mass splendidly, as do the gladioli, and improve by long residence in the ground. The culture of the bulbs, actual and so styled, is indicated elsewhere, both as to pot, glass, and outdoor growth.

Cacti.—Cacti like little pots, and quite as much sand as loam and peat to form the staple of the compost they stand in. Deep drainage and plenty of charcoal is more than half the battle with these curious succulents, and lime rubbish or crushed brick and well rotted leaf soil should be mixed into the mould when potting, all being dry when a start has been made. They require winter rest without much moisture, and should only be encouraged by gentle watering to make new roots in May; when a little later on any really essential re-potting should be very carefully undertaken. The cacti make capital window plants if the soil they are set in is well guarded against becoming "sad," and the rat-tailed, creeping cereus is a rare good hanging basket subject. Properly speaking cacti are greenhouse plants, and when their singular and brilliant blooming occurs they are most interesting. Shoots from the stem are easily rooted, if dried a little after breaking off, or seed may be grown.

Caladium.—A very beautiful, variegated-leaved, tuberous-rooted plant, nearly all the varieties of which do best in moist heat and regular shade. Eucalyptum and violaceum, with one or two more sorts, however, will grow if properly placed in a warm greenhouse or conservatory, and are particularly decorative. Young plants should be procured from a nursery, and treated carefully, when good results may follow. Rich soil, with peat and silver sand in plenty, must be employed in potting.

Calceolarias.—Beidling or shrubby calceolarias, yellow or orange, are propagated from cuttings made in September when the borders are cleared. These should be put into beds made in frames from which the frost can be excluded by a mat covering, and given little water till February, after rooting is ensured, though air should be given on damp days. A spring approach to the lights may be permitted by day, and replaced by night when frost is feared, gradually hardening off and giving more water until the time for

planting out, which is usually quite rare in mid-May. Pot specimens may be brought on earlier by transplantation and removal to the greenhouse. The large-flowered herbaceous calceolarias are usually raised from seed sown in summer in pans or boxes filled with rich moist sand-covered soil under glass. The minute seed should be thinly scattered on the surface, and when the seedlings can be handled they must be pricked off separately, and gradually potted on as necessary, watering and shading carefully after each shift. Heat is not essential, in fact, it is undesirable, in successful calceolaria culture, but fresh air as far as is consistent with safety, good soil, and good drainage are; also vigilance in keeping down vermin. In greenhouses well-grown calceolarias of the show kind are grand objects when symmetrically stalked for bloom.

Calandula.—These orange or yellow Scotch, or pot marigolds are particularly easy to grow, and yet most effective for filling gaps in exposed borders or shrubby belts. Once established they usually reproduce themselves profusely from self-sown seed.

Callipatria.—(See *Ceropegia*.)

Camellia.—This greenhouse favourite of Christmas time, with its beautiful waxy bloom and glossy leaves is harder than most amateurs imagine, and does well if kept clear of severe frost and intelligently handled. It does not ever need artificial heat except for forcing purposes, and early growth and maturity may be induced by judicious culture. After flowering is over early in the year the plants should be potted, if badly root-bound, and put in a cool place slightly sheltered, and when growth commences be moved right into the open, syringing often and keeping moist. Only when the flower buds are formed and the shoots well-ripened should the plants be taken indoors to protect the blooms and beautiful window or conservatory. They thrive in any really good soil, strong loam with sand and peat, and like an admixture of clean, rotten wood or rich leaf-mould. The camellia comes from China and Japan, and is a relative of the tea-plant. The red and white selfs are the best and most floriferous, but there are pretty striped and fringed sorts procurable. Shoots taken when just matured will root with care.

Campanula.—*Pyramidalis*, especially in the white variety, is a beautiful perennial bell-flower, and will flourish in any one place for years, besides being easily divided; and fragrant, and is a relative of the tea-plant. The Canterbury bells, biennials, are favourites everywhere, and deservedly so, for they virtually cultivate themselves, and give bright bloom over a long period. All the species may be readily raised from seed, and the florists have brought about many mutations, both in doubles and singles, and really good strains are cheaply offered in small quantity in nearly every catalogue.

Canary Creeper.—(See *Tropaeolum*.)

Candytuft.—No garden should be without this prolific flowering annual, so useful for cutting and so pretty in the borders. It has been immensely improved by culture; and reliable mixed seed sown in autumn in rich, light soil, and transplanted in due course, will give great satisfaction. The dwarfier varieties are most effective for bedding, the pure whites and deep purples particularly so. There are also biennial and perennial candytufts.

Canna.—This tropical plant, commonly called "Indian Shot," finds favour in many eyes because of its beautiful leaves and gorgeous bloom. It will succeed either as a greenhouse subject or bedded out of doors in a sheltered situation for the summer. Seed may be sown in early March under glass, and will grow rapidly if previously soaked in hot water. When flowering is finished out of doors, the roots may be stored for another season in dry soil in pots or boxes. Canna growing, once begun, will rarely be relinquished by amateur gardeners of taste. The canna is a gross feeder. Although of Oriental origin it is an adaptable plant.

Canterbury Bell.—(See *Campanula*.)

Carnation.—Carnation-culture is most fascinating, whether growing from seed be adventured, piping and layering be favoured, or all three be indulged in, and flowers successfully produced by any of the practices

may be very beautiful. There are selfs of many colours and shades, clove-scented and odourless, flakes and striped varieties, large-bloomed and small, tall-growing and dwarfs, compact marguerites on short stalks and quick flowering, each taking some care to cultivate, but all repaying the trouble, especially when experience has shown the way to avoid failure. Then there are the aristocrats of carnationdom, the winter or perpetual sorts that lord it indoors when gardens are at their barest. The latter are propagated chiefly from cuttings, and grown along in slightly-heated, well-aired frames or houses to tall flower growth, with beautiful results at the year end, when the cutting striking commences *de novo*. The marguerites, youngest of the carnation clan, are handled as annuals, from seed sown in gentle heat—a well-regulated hot-bed will serve—in February, transplanted under shelter, and finally put out in the blooming bed. From the best seed a good proportion of singles will come, often with the finest grass, but even these are decorative, and the grower will get some pretty surprises in doubles and baby bizzars, so to speak, besides a few showy singles, and perhaps a handsome yellow two in a small bed. The more orthodox Carnation offers wide scope for specialisation. You may grow the strong and velvety crimson old clove or antique gardens, which pleases the many still, or you may go in for yellows and yellow-ground, terra-cotta of size, all whites, or this or that class of colour marking; and then there are always the picotees to proceed further with. The method of culture of one will serve for the rest, and no two growers do exactly alike as to detail. Reliability as to true succession comes of cuttings, pipings, or layers struck and rooted in July, and later potted off or transplanted, but seedling from particularly choice blooms of your own production attracts a good many, because of its chances of getting a distinct novelty. April or May are good months for seed sowing, in pots or small boxes, covered by a pane of glass. Transplant the seedlings as soon as you can finger them into a bed of rich soil, at least nine inches apart, and let them develop. A cold frame may be advantageously placed over the bed for protection during the first winter. The best soil to grow carnations in, either as pot plants or in beds, is one-third well-rotted cow-dung and two-thirds rich maiden loam from mellow decayed turves, free from insect life. Pippings are young shoots drawn from the joints and started to root in light sandy compost under a hand glass, cuttings shoots which will not layer conveniently, and layers—the surest way of propagating of all—the bedding down, underslitting, and ground-pegging into good soil of strong side-shoots from the flowering plants in summer late June to August. These are detached and potted off after rooting. Many pot them in pairs, and they should be well-drained, eight-and-a-half inch pots being a good size to employ. Careful staking is requisite when the flower stalks are put forth. Keep away wire-worms from the roots and green fly from the grass.

Caterpillars.—(See *Pests of the Garden*.)

Celasia.—This is an old-fashioned singularity among half-hardy annuals, the variety *Cristata*, commonly called the Cockscomb, being a favourite for its curious crimson flower crest. Some of the other Celasias have pretty feathery spikes of bloom, which will dry well for vase furnishing. The seed comes up quickly from a March sowing over bottom heat, and the plants may be potted on for greenhouse beddecking or ultimate planting in borders, where they make a brave show.

Centaurea.—(See *Corn Flower*.)

Cerastium.—*Snow in Harvest*, a very valuable as a spreading border, herbaceous perennial, the variety *Tomentosa*, has soft, silvery foliage, and white flowers. It is propagated by division in early summer, and should find a place in every garden.

Chamaerops Excelsa.—The fan palm, a good conservatory decorator, or tub plant for a summer terrace or lawn, doing well in fibrous loam. Only needs protection from severe frosts in winter, and readily raised from seed or off-set suckers; it will stand out doors all the winter in favourable localities.

Charcoal.—This is indispensable as a filterer of the soil in plant pots, to prevent the formation of dangerous

acids, and charcoal dust mixed with any kind of mould is always of excellent effect. Well saturated in liquid manure the lumps and nodules of charcoal also act as a fine plant-feeding medium.

Christmas Rose.—The black Hellebore, a hardy perennial, with white blossoms in winter, and loves the shade. It will flourish in ordinary garden soil, and is propagated by division. Some pot it off for indoor decoration in December.

Chrysanthemum.—*Chrysanthemum* culture has made remarkable headway during the last generation, and one can get flowers now as big as saucers almost, with petals fantastically curled and twisted, or close globular bloom of exceeding beauty and rich colouring. Of the choicer sorts there are incurved and reflexed, pompons, Japanese, anemones, and others. Then we have the earlier blooming varieties of the garden, nearer the old type. The annual *chrysanthemums* also are very good for flower-cutting and decoration. These may be sown in April, on a sunny border, and afterwards transplanted or potted up. The early-flowering Japanese garden varieties can be propagated by cuttings or from seed, and grown by division. They need staking to withstand wind. The more ornate varieties call for a good deal of cultural care, but no coddling. Raised from cuttings or layers, they may be potted in April, shifted again in May, nipped back and hardened off, and finally transferred into good-sized blooming pots towards the end of June. They should be permitted to grow out of doors until October, and then moved to the greenhouse to flower, being well cleansed beforehand. No flagging must be permitted at any stage, and weak manure water must be frequently administered. The best soil is rich fibrous loam, with a little leaf-mould and decomposed cow-dung, and a plentiful sprinkling of clean, sharp sand and powdered bone. For extra fine flowers the side shoots should be kept down as well, the tops pinched off, and the fewer stems in a pot the better. Let the stock come from a good source, rubbish takes as much trouble as the best. When the old plants are cut down, they may be divided, potted separately, and given a good rest before new growth is encouraged.

Cineraria.—These early flowering favourites of the conservatory can be started from seed sown in May in heat, the seedlings being potted off singly and placed in a cool frame until late autumn. Finally at the flowering size they may go into a warm greenhouse to develop the flowers, which should begin to appear in October, and bloom on to Christmas or after. A compost of leaf-mould and rich loam, well mixed with old stable manure and powdered charcoal, as well as coarse, clean sand all being left rather rough will suit. In the growing state *Cinerarias* will absorb strong liquid manure readily, being particularly hungry subjects. Shoots at all weakly should be eliminated to give vigorous growth play, and the green fly pest kept down by fumigating the frames as necessary. Many lovely sorts may now be had.

Clarkia Pulchella.—Pretty purple, rose, and white hardy annual, eighteen inches in height.

Clematis.—These elegant trellis climbers, which luxuriate on sunny walls or in well-ventilated houses and make nice pot plants also like a good strong soil. They will stand nourishment, freely administered, when grown indoors, and should have judicious root-dressing when established in the open. The Jackmanii varieties are rich and fine, and vigorous of growth, and there are other choice sorts with large blooms. Some care is requisite in propagating, mostly obtained by striking sprouts, or short, dead shoots, in light sandy soil under a handlight. An easier way is by root division, after careful loosening up at the growing period. All the good clematises should be neatly trained as they extend, and weak shoots cut away.

Climbers.—Climbers are essentials of the garden and greenhouse, and for wall covering everywhere. As regards outdoor climbers, the best rule is to grow what does best in a particular situation in any given neighbourhood. The Virginian Creeper will spread fast and flourish anywhere, and the small-leaved, self-clinging variety, *Ampelopsis Veitchii*, is always neat. It has inconspicuous flowers and loses its leaves autumnally, but their gorgeous colouring at the close

of the season may be taken as compensatory for deciduousness. The ivies, particularly the small-leaved and variegated sorts, make pretty and permanent clothing for a house wall, and to do them well a deep and rich soil is requisite. Some other favourite outdoor climbers are the *Jasmines*, both the scented white, and the yellow flowering sorts, the latter blooming before leaves; the *Clematises*, which prefer a good loam and south aspect, the *Loniceras* or honeysuckles, which like shade and shelter, especially the yellow, reticulated Japanese kinds; the graceful *Wistarias*, with racemes of pale blue or white, that flourish in peaty mould, the *Fassion Flowers*, that need protection in winter where exposed, and must have a light soil to make the best of; the evergreen *Magnolias*, requiring a sunny, sheltered outlook; the winter sweet (*Chimonanthus*), with fragrant orange flowers opening about Christmas under favourable conditions; the Banksian and other small-blossomed, rambling roses, besides the tea-scented *Glorie de Dijon* and *Souvenir de la Malmaison* and their congeners; the vines, the tocomas, the bignonnias, catkins, carrying *Carrisa* slipper, the graceful coral barberry, the accommodating fern-thing which will grow anywhere, the bluebush, (*Ceanothus*), and the curious Dutchman's pipe (*Aristolochia*). Here is enough to choose from, and there are others. Most of them will increase readily from slips, layers or root cuttings, and the rest from division. They all need trimming and training at the proper season. The tenderer flowering subjects may be utilised as greenhouse climbers, where also the *tacsonias*, *lapanerias*, the *stephanotis*, *plumbagoes*, *kennedias*, and others may advantageously be allowed a free run either in a pot or border rooting, roomy and well-drained.

Cockscomb.—(See *Colossa*.)

Colchicum.—(See *Crocus*.)

Colossus.—French nettle, some style these particularly beautiful-leaved greenhouse plants, which luxuriate in moist heat, and whose variegated and often gorgeous foliage make them great favourites for all decorative purposes. Young plants, carefully hardened, may be put out late into summer garden borders, but should have a sheltered site, for cold winds nip them up, and they die at the first frost bite. They propagate nicely from cuttings struck in bottom heat in a close frame in close firmness. Rich soil is their delight, and fearless pinching back induces a compact habit.

Collinsia.—A genus of bright border annuals; bicolour, purple and white, 9 inches, very serviceable.

Columbine.—This is a very old cottage garden favourite, but the florists have improved it out of all knowledge latterly, and many long-spurred varieties of the always pretty herbaceous perennial obtainable from seed are extremely beautiful. They may be safely sown in April in any ordinary garden soil, and transplanted later on to nursery beds for ultimate removal to a permanent position. These hybrid columbines yield acceptable cut bloom.

Compost. (See *Soil*.)

Conservatory, The.—This is properly regarded as display house for the reception of plants brought to the perfection of efflorescence or foliage by culture, or an airy structure full of floral beauty. It is not, strictly speaking, so much a structure to grow as one to show plants in. Therefore, it should be spick and span and only of equable temperature; and it may advantageously open out direct from the dwelling-house, intervening between that and the greenhouse, vineyard or stove beyond, where such exist, and receding its subjects in full dress from them or from frames and pits in the garden. The conservatory should always have plentiful provision for ventilation, and is best situated on the southern side of any house, with which it should harmonise, as much as possible, as to size and otherwise, communicating by means of a glazed passage or corridor when spanned. Those who have but one glazed structure, and do virtually all their propagation and plant growing therein, will be well advised to call it and consider it a greenhouse, leaving the conservatory cognomen to the possessor of larger resources. The shadier portions should have place for ferns, palms, and indoor ornamental ever-

greens, or variegated foliage plants may occupy permanent positions of vantage in the Conservatory, the rest should be a constant/ changing exhibition of the best floral things attainable by its owner, leaving space sufficient for social enjoyment, the chief reason for any conservatory's existence.

Ceanothus.—Annual; dwarf or minor, a foot high, various colours, major, the climbing sort, is useful for trellis-work or trailing, and also possesses a variety of bloom.

Ceropegia.—Called also Calliope, a family of gray and useful border annuals reaching a foot or more high, bearing prolific blossom and chiefly a shade of yellow or yellow with red centre. Likes full sunlight, and grows readily from spring or autumn-sown seed, plants of the latter flowering, after moving, early and vigorously.

Corn Flower.—The Centaureas are showy things, growable in any garden. The bright blue cornflower is the favourite but the white comes in for cutting acceptably, and so does the rosy tinted. Then there is Depressa, an uncommon crimson-centred, dwarf-growing blue head, obtainable from seed of most nurserymen. All can be raised by autumnal or spring sowing in the open, and the seedlings take kindly to transplantation. The sweet Sultans are Centaureas, and their fragrance and floral beauty should secure them admission to any home plot. Suaveolens is their specific name, and they should be thinly sown on a sunny border in July in light soil for transplantation next season.

Cornflower.—These spring favourites may still be seen in many borders, and some of the hybridised and American sorts are pretty and useful. Sow seed in June for following season's flowering, transplanting in autumn.

Creeping Jenny.—See Money Wort.

Crocus.—This early spring blossomer, though not strictly a bulb, is generally so regarded and treated accordingly. It is a perennial, and once planted will last, if undisturbed, for some years, but division betters it occasionally, though no crocus should be taken out of the ground till its leaves are quite dead, when the roots may be stored away if space is needed for summer bedding. Mellow loam suits them, and they may be raised from seed sown thinly in sandy soil, the seedlings being pricked off later to develop. There are yellow, white, light blue and purple crocuses, also variously striped sorts, all quite hardy. When planted in early autumn in good light mould, two to four or six inches deep, they will make a brave show in spring, especially if massed, and they do well in sunny window boxes as well as in beds and borders, and can be grown indoors in saucers of rain water, containing small pieces of charcoal. Colchicum autumnalis, an autumn bloomer, as the name implies, should be planted in spring; its foliage dies in summer and grows again after flowering. The Dutch and all other crocuses are readily procurable in the finest sorts at a small outlay, and yield attractive bloom for years.

Cuphea Platycentra (Cigar Flower).—A pretty bedder, with almost black, scarlet, and white flowers, twelve inches high, grown from seeds or by cuttings.

Cut Flowers.—Flowers of all kinds are best cut for preservation or transit in the early morning before the sun has wilted them, while fern fronds may advantageously be gathered in the evening, and if placed for decoration purposes in vessels containing clean rain or distilled water and kept away from strong light or well below the level of artificial illuminants they will last longer than if carelessly dealt with. Renewal of the receptive water with coincident cuttings of the stalks of choice blooms, tends to prolong their duration. To pack for post put damp moss or grass to the bottom of a light, strong box covering with soft paper, arranging the heaviest blooms at bottom and the more delicate sprays and foliage above, leaving all firm but lightly disposed.

Cuttings.—Generally speaking cuttings of all kinds should be taken in dry weather or from pot plants which have not recently been watered, short jointed vigorous shoots being selected when the subject is in good growing condition. A clean cut with a sharp

knife must be made immediately below a joint on the detached shoot, all leaves, which would touch the ground, being removed. In planting, the soil in the box, pan, or bed, should be firmly pressed down and moist, and the cutting, save in exceptional cases, inserted only one-third its depth. Shade is essential, though light must never be excluded, and the plunging of pots containing cuttings is commendable. Silver sand and light sandy mould make the best cutting-striking material, and there should be ample drainage, for free air percolation through the soil is a requisite of success. These general directions apply to all sorts of soft-wooded cuttings, of bedding plants particularly, and most of them will strike quicker if placed over slight bottom heat. In some cases very desirable, indeed dahlia cuttings, for instance, will hardly do well without it. Myrtle, heat, camellia, and other hard-wooded subjects want little warmth below, but should be struck down to the drainage level in the striking pots. Side shoots from towards the bottom of the stem of a thriving plant, the shoots themselves ripe as to wood, and not yet case-hardened, give the best results. Fingers should carefully be removed from cutting groups as soon as discovered, or they will injure the rest.

Cyclamen.—Easily grown and graceful winter and early spring flowering plants for frame and house culture and conservatory decoration in winter. From seed sown very thinly in sandy, peaty loam, in pans kept at a temperature of between sixty and seventy degrees, and kept covered with glass or near the light in a greenhouse, the cyclamen can readily be raised. The seedlings may in due course be potted singly, and kept clear of frost influence. For blooming one bulbous root—it is not a true bulb—should be allowed to a five or six inch pot, particularly well-drained and filled with a compost of loam and leaf-mould, with a liberal admixture of well-rotted manure and sharp sand. Do not more than half cover the root with the soil, and press down firmly. After blooming give the cyclamen a rest, plunged in a shady border, and when the pretty leaves begin to grow again, repot, shaking the roots partially clear of the old soil. Cyclamens revel in moisture but must never be stagnated. They want air without draughts, and an equable temperature, plenty of light on winter days, and shelter from summer sun.

Cyclamen.—This pretty cool greenhouse and dry-soil garden subject—often catalogued by the dealers as Genista—yields a profusion of bloom, chiefly yellow, in spring and summer. All the brooms which this class comprises are easy to cultivate if one will but bear in mind the hot soil of their natural habitat. They are deciduous, and the smaller-flowered kinds, with their graceful foliage and tiny pea-shaped blossoms, are very decorative when in their full beauty, looking particularly well in a parlour window. The Labrum, whose golden tassels are familiar to town-dwellers in the early summer, is an arboreal Cyclamen.

Daffodil.—(See Narcissus.)

Dahlia.—Dahlias of all sorts must have strong sunlight and a free, airy situation to flourish in above ground, and rich gross feeding below. For each plant, when frost fear is over, a big enough hole should be dug in the open soil being taken out to a good depth and replaced with enriched rough mould to let the roots run in. It is well to put in a stout stake at the time of planting, and to protect the young dahlias from the slugs until it has grown out of harm's way. Leave a couple of yards at least between every two show or double dahlias if you desire fine blooms, and give copious manurial waterings as they grow. Trap straw with hay in small inverted pots at the top of the stakes when the flowers come, or they will lodge in and devour the petals. Cut away lateral growth, leaving but few branches and those the strongest. Relatively these instructions apply to the fancies and the pompons as well as to the big double show sorts; also to the singles and the cactus kinds, all of which now include many beautiful varieties. When frost blackens the dahlias in early October cut them down, and lift the tubers, putting the old sets away dry in a shed in boxes of sand or fibre, or ashes will do. As spring comes on shoots should be encouraged by re-

moving the roots to a greenhouse or warm frame, and these be taken off to start growth in small pots ready for planting out in June, labelling each correctly. Cuttings may also be made from the plants in autumn, and kept over the winter under shelter after striking, except in special circumstances.

Daisy.—Double daisies, white and red, quilled, or the hen-and-chickens variety, make nice border plants, and are serviceable for edging purposes. In good loams they will give a fine and long-lasting flower display, and may be raised from seed, though a certain amount of singles is sure to come. Propagation by division is sure, if done when flowering is over.

Delphinium.—To this genus belong numerous beautiful border annuals and biennials, as well as perennials, varying in height and colour. They are fine for grouping or for planting singly, the taller sorts being mostly bright blue, but there are delphiniums with spikes of pearly white and a particularly vivid orange-scarlet sort of dwarf habit. The annuals are sown in the open in March where they are to flower, the biennials and perennials in June and July, and transplanted when large enough to nursery beds or put where they are required to remain.

Deutzia.—A class of hardy flowering shrubs, bearing beautiful white bloom, like thin-stemmed snowdrops. Increased by cuttings, struck under glass in August, and liking a mixture of rotted cow-manure and loam to grow in. For forcing and pot culture generally the deutzias are well adapted, being very decorative when in flower. *Deutzia gracilis*, a compact, free-flowering dwarf variety, is a capital plant for window or conservatory.

Dianthus. (See *Pink*, also *Sweet William*.)

Dielytra.—*Dielytra spectabilis*, sometimes called the "lyre flower," is a pretty and popular herbaceous border subject, bearing handsome, bending branches of peculiar pink bloom, and having very attractive foliage. There is a white-flowered variety, less common, but easy to grow in light, rich soil. Both may be brought on for early show in pots in the conservatory, and readily increased by division. It is advisable to protect from severe frost, and they will take up a lot of water when coming into bloom.

Digitalis. (See *Forgive-me*.)

Dusty Miller. (See *Auricula*.)

Dutchman's Pipe. (See *Aristolochia*.)

Harwig. (See *Fests of the Garden*.)

Hecoreocarpus.—Half-hardy flowering climber, bearing racemes of orange bloom, will stand in a sunny spot out of doors in winter, if cut down after flowering and covered with litter till spring. It will ramble over stumps or trellises prettily. May be raised from seed in a hotbed in autumn; young plants being thus obtained for spring culture in the open, or for pot use in a greenhouse.

Hebeveria.—This is a rosette-shaped succulent, a good deal employed in ornamental bordering nowadays, and used also in rockwork. It carries a curious coral red spike of bell-shaped blossom, and grows well in any good, light, sandy soil. Increase by off-sets, which root with facility.

Hed-Plant.—A curious half-hardy annual, botanically styled *Solanum*, delighting in warmth and light rich soil. Seed should be sown in early April in pots plunged in a hotbed, the young plants being potted and placed near the glass as soon as they can be handled. When wanted to fruit in the conservatory or parlour, they should be transferred to good-sized pots. They will do well in frames if kept free from red spider by syringing; a little stimulation when the fruit is setting is helpful.

Erica. (See *Heaths*.)

Erodium.—Hardy rockery and edging perennial, dwarf and fond of dry warm situations; carries purple-spotted white bloom, propagated by root-partition, also from seed.

Erythronium.—Hardy annual, the orange-flowered *Perostichium*, twelve inches, makes a pleasing border subject.

Eschscholtzia.—California annuals now largely employed in furnishing our summer flower-borders. They are very hardy and may be sown thinly where they are to bloom in April. The yellow coloured

varieties are the most common, but there are orange-flowered, rose, carmine, and white *Eschscholtzias* obtainable of good seedsmen; also a perennial variety, California, with big, beautiful, deep orange-centred bloom. Some of the sorts close their flowers tightly at the approach of rain. They belong to the poppy class.

Eupatorium.—This is a genus of flowering herbaceous or shrubby plant introduced from America, chiefly used for greenhouse culture and closely related to the hemp agrimony of our British marshes. Some send up stalks of white tassels of bloom from the low leaf growth. They may be propagated by cutting, covered with a bell glass, and grow best in sandy peat and loam. There are purple and pink kinds to be had, and the vivid green of the foliage is very attractive. They may be moved out-of-doors in the shade in summer.

Eutoca (Phacelia) Viscida.—White-eyed border annual, one foot.

Eucyonium.—A common yet popular garden shrub, amenable to urban surroundings. Most glossy green. There are some variegated sorts, but all are ornamental, hardy, and easily increased by cuttings struck in good loam in the autumn from the preceding year's shoots. *E. europaeus* is the Spindle tree.

Evening Primrose.—This well-known flower is one of the *Einotheras*, which include a number of useful edging, border, and rocky plants, some of them annuals, others biennials, and some of perennial growth. The Evening Primrose is a biennial, but, if sown early, will bloom the same season. Its bright yellow blossoms, folding towards nightfall, are very familiar. The *Einotheras* prefer a light yet rich soil.

Everlasting. (See *Helioscymus*, also *Rhodanthe*.)

Ferns.—Any garden or greenhouse without ferns is quite incomplete, and nothing grows more easily if properly placed and treated. They require shade, all of them; and most prefer moisture as well. A good general soil to plant them in is a mixture of fibrous loam (mellow and fresh), clean sharp sand, and good leaf soil. In pots they should be well-drained, with porous sandstone in jumps above the sherds and mixed with the soil. Peat is helpful as a further ingredient of the compost for the tenderer ferns. All should be very firmly secured in pot or ground on introduction.

For outdoor growth in shady corners under walls, or in parts of rockeries where the sun's direct rays never reach, nearly all the British ferns, of which there are multitudinous forms, can be successfully cultivated; while under the stages or other positions in the shade within a cool greenhouse many exotics will grow luxuriantly. There the maidenhair and other adiantums are invaluable for decoration, and addition to flower bouquets, as are the pterises, aspleniums, and lygodiums. Of larger growth are the anthuriums and the osmundas, while the polypodiums, polystichums, scolopendriums, and hare-foot ferns can all be tackled successfully. Filmy ferns like the todia, trichomanes, and hymenophyllum may be grown under bell-glasses to conserve moisture. Ferns should be made the most of by every amateur.

Ficus Eliastus.—(See *India Rubber Plant*.)

Flax Plant.—(See *Linum*.)

Flos Adonis.—Hardy annual, deep red, nine inches.

Flowering Currant.—(See *Ribes*.)

Flower.—(See *Cut Flowers*.)

Forget-me-Not. The *Myosotis* are annuals, biennials, or perennials, but it answers well to grow them from seed as border plants, for the dainty blue blossoms are everywhere welcome. There are pink and white varieties, too, which will repay sowing in June for the following season's flowering. It is an accommodating plant, but always appreciative of water, and the shadiest part of the garden suits it better than full exposure to summer sun. A good strain of seed should be secured to begin with, and increase by division relied on later.

Fox Glove.—Handsome cultivated varieties of the *Digitalis* of our woodlands are easily raised from seed or propagated by off-shoots. They do admirably on

shrubbery borders in any ordinary soil, and there is a particularly fine white sort to be had at most nurseries, as also red, purple, yellow, and spotted varieties. A packet of good seed will produce pleasing results where there is space to exploit the foxglove properly. It should be remembered that the *Digitalis* possesses poisonous properties.

Frames and Pits.—These are of immense value in any garden, both to the possessors of greenhouses, conservatories or forcing houses of an ambitious character, and to the more modest horticulturist who relies entirely upon them and the hotbeds they may contain to carry his delicate stock through the winter. They are easily and cheaply constructed if one be content with things on a small scale. A glazed light or two will cost little, and any gardener can make his own frame out of rough wood, and to his own liking, movable or for placing permanently over a pit excavated in the ground. The principle to be insisted on is that they should be highest at the back, sloping towards the front, and that they should be fitted so to receive the top light when in position that rain is excluded. The frame may stand on low brick walls or stacked turves, or rest on the ground as considered most desirable. The earth may be excavated pit-form to secure depth according to requirement; and the interior may be wholly or partially filled with properly prepared stable manure to form a hotbed on which soil is superimposed, and thus may be renewed or removed when spent. Rows of frames can be arranged for more extensive operations by lengthening front and back and placing rest-rails to support the inner edges of the lights. The most costly purchasable frames are only elaborations of this idea of securing protection against frost, and resisting the influence of changeful external temperature generally; and the home gardener who knows how to adapt himself to circumstances will meet with a surprising amount of success at but little monetary outlay.

Gardenia.—A charming greenhouse evergreen, bearing beautiful waxy bloom, very odoriferous, and much in favour for button-hole wear. Will do best with much moist heat and profuse watering in the growing period, and whilst flower forming. Sandy, peaty soil, very rich is requisite, and a bottom heat of at least 50 degrees must be maintained to root heeled slips in well drained pots of silver sand and peat. *Gardenia florida*, the "Cape Jessamine," is a good sort for the amateur to grow.

Genista.—(See *Cytisus*.)

Geranium (*Pelargonium*).—The geranium, of all half-hardy subjects, is best styled everybody's flower. It possesses infinite variety as to foliage and blossom, and no sort is difficult to deal with. The zonales, so universally employed in window decoration, boxes, vases, greenhouses, conservatories, and as bedders, possess handsomely formed leaves, and bear beautiful bloom trusses, single and double, in colour from pure white to vivid scarlet, with rich salmons, delicate cerise, and many gradations of pink. These may all be kept sturdy and shrubby by toping, or trees; to grow tall at will. There are gold-leaved and silver-leaved sorts, bronze and gold varieties, silver tricolours and yellow tricolours in charming diversity, lovely as to foliage alone, and all floriferous. Then there are the scented sorts, with beautifully divided leaves, the staghorn lemon-scented and the peppermint variety; also the ivy-leaved trailers, single and double, with all the colours of the plant-foliage and the zonales; and through all the many mutations produced by hybridisation the geranium remains an easily grown favourite. Propagation is best by cuttings, taken when the old plants are most vigorous in July or later, rooted and left to stand in cold frames or greenhouse, or potted on at will towards the following bedding-out time, or as a further alternative converted by encouragement into specimens of size. The old plants after cutting down and potting out do best for this, being first given a good rest. The soil employed should be light and sandy, well drained and firmly pressed down for pot culture. For flowering well use small pots. The many beautiful varieties of show and fancy *pelargoniums* which are distinct from the zonale geranium,

are useful for conservatory and greenhouse treatment being harder than their more generally cultivated relatives. Regal *pelargoniums* these are often called, and there are the French spotted and large and small varieties, as well as the more elaborate doubles. They are increased by cuttings, best potted slugs in a dry light sandy loam after taking from the parent plant when the flowering season ends, and plunged in mild bottom heat to facilitate rooting. The pot on gradually pinching as root growth is encouraged and hardening by exposure to air as development goes on. When flower buds begin to show, the plants, then in their blooming pots, may go into cold frames or greenhouse, the former preferably, and be kept well syringed to stave off insect attacks.

Geonura.—Tuberous, hothouse, herbaceous, flowering plants, requiring rich soil, plenty of moisture, and a warm even temperature for successful culture. May be raised from January sown seed, by cuttings of shoots or leaves, or by tuber division. Compost of peat, fibrous yellow loam, and sand, in well-drained four to six inch pots will be needful for securing good blooming plants. The scarlet sorts are very showy when in bloom, and great care is essential to keep them clear of thrip.

Gladiolus.—This is a grand subject for autumnal display in massed beds, and may be raised from seed as well as from the tiny-looking bulbous off-sets of the old corns. There are numerous sorts of the "sword-lily," as this gorgeous plant is popularly styled, the early flowering and forceable *Colvillei* furnishing one fine type, and the *Gandavensis* and *Branchleyensis*, besides hybrids, other sections. The latter is the more common, and bears brilliant spikes of various colours in profusion. The corns may be planted out in good garden soil, rather light than strong, in March, cleaning the old roots and mould away and inserting each firmly in a surrounding of sand or dry ashes. They delight in a sunny situation protected from strong winds, and a dressing of well rotted manure over all after planting will be serviceable. The Bride and other early blooming varieties may be brought on by pot culture in pits for house and conservatory flowering. It is advisable to take up the corns from bed or border in late autumn when the leaves are dead, storing them in soil for next season's planting.

Gloxinia.—*Gloxinias* are generally regarded as stove or hothouse subjects, but may be cultivated successfully in frames where an equable hotbed is maintained, or in any warm greenhouse. They are exquisitely beautiful, and repay the trouble necessary to obtain the best result. Seed may be sown in fine soil in February, the pots being plunged under a bottom heat of about seventy degrees, which should be kept close by covering with glass, giving air cautiously. Cuttings from shoots sent up by old tubers may be grown similarly, or leaf cuttings can be taken and struck on silver sand over peat and fine soil in a hotbed. Transplantation after rooting and watchful care will secure bloom in the autumn for the young subjects, while the old tubers may be reported in spring in suitably-sized well-drained pots, filled with rich compost in which sandy peat preponderates, the result being a fine mass of magnificent bloom springing from beautiful fleshy foliage. Colours vary in the flowers from white to crimson and purple, with blotchings and splashing of captivating richness. Seed or tubers should be obtained from the start from a reputable source, the best being the cheapest in the end.

Godelia.—The purple flowering form of the popular *Evening Primrose*, or *Oenothera*, treated as a distinct species by many florists. An effective border annual, about a foot high, and quite hardy enough to be sown in the open in April for transplantation.

Grass Lawns and Borders.—Grass plot should be properly made, to begin with, and thereafter kept in trim by constant care. Get the ground, after digging, firm and even, and have it well cleared from any weed roots. Let it be slightly high in the centre, sloping regularly to the edge limit all ways. Then lay down turves, well mown, from old fine grass pastures, free of dock and daisies, in early spring. The turves should be clean cut, about one inch thick, a foot wide, and in 18 inch lengths. Get the strips close together,

and beat them down thoroughly. You cannot roll a newly laid lawn of turves too much, providing you keep it damp. Mow with a scythe as new growth commences, then roll again and again. Once the turves have attached themselves, you may use the lawn mower instead of the scythe, but watering and rolling are of the utmost importance. Get the grass established before midsummer sun can burn it. Nightly hoeing will obviate this. If you cannot utilise turves, buy the best prepared lawn seed mixture of a regular seedman, and sow it in March or April when there is no wind on the nicely-levelled surface, lightly covering it with sifted soil. Late August or September will do for the sowing, but early spring is better. A quarter of a pound of seed will suffice for two square yards, and it must be distributed evenly. Water nicely with a hose or can, after the seeding, unless steady rain immediately falls, and stretch black thread crosswise to pegs a few inches over the surface to impede sparrows foraging for seed or tender blades of grass. Also keep off children, cats, and dogs. Gently and frequently water and wait. Then when the grass is four inches high shave with a sharp scythe, mowing warily, and sweeping tenderly with a soft broom. Water again, always in the evening, mow and sweep once more. Next time you may put a light lawn mower over it, and leave the cut grass lying as it falls, sweeping before the following mowing. It will form a protective mulch against hot sunshine. Rolling on new-down grass must be commenced with caution, and seed should be scattered carefully and given attention where bareness is threatened. You cannot take too much trouble in getting the right start. Anything coming up coarse should be eliminated, and any hole made in so doing firmly filled, introducing a little seed at the time, until all looks, after mowing, like a billiard board. Thereafter keep it so by regularly cutting, sweeping, and rolling in spring, summer and autumn, and occasional attention as requisite in winter. Grass edgings should be kept constantly trim, using shears when that is most convenient; narrow strips of grass form the best and prettiest of all borders if kept close shaven and evenly green, but they must not be walked on like the pathways. Grass, in its place in the garden, may always be kept beautiful, and care to conserve it so carries a rich recompense of solid satisfaction.

Green Fly. (See *Pests of the Garden*.)

Greenhouse. The—"Who loves a garden loves a greenhouse too," sang Cowper in "The Task," and with the spread of garden love amongst us, there has certainly been a great growth of greenhouses, humble and spacious. Artificially-heated structures are requisite where half-hardy and tender plant culture is carried on to any considerable extent. They can be produced in sections, and are adapted for putting up in the most favourable available position, in sizes and at prices to suit almost every purse, as tenants' fixtures, so that any artisan or clerk can now-a-days have his own greenhouse, according to his circumstances or desires. Greenhouses may be either span-roof, independent of any other structure, or lean-to, the back being furnished in the latter case by a boundary wall or that of the dwelling house. They may be simply glazed and rendered water tight (with proper provision for ventilation) or they may be fitted with heating apparatus of a more or less elaborate character. The cool greenhouse, which excludes winter rigour from its occupants, will be found very serviceable to those of modest floricultural ambitions, especially if it be placed facing southwards. That to which provision for heating is added will answer, with any aspect, but this and the means employed for keeping the temperature artificially raised must be regarded as considerations of individual convenience. Supplemented by a frame or two, a greenhouse of even a small size presents many pleasing possibilities, from the growing and reception of various specimens of fine-flowering and otherwise ornamental plants, which may be removed to the parlour or conservatory when in full beauty, or remain to deck the stage on which they have arrived to perfection, and also for the propagation and preservation of subjects which will not winter safely with us' out of doors. Stepped staging is advisable where practicable, in combination with a

flat and comparatively narrow stage at the glass front returned at the ends, with additional and movable shelving near the roof on suspended brackets, also above the table-high side stage. Plenty of room should be left to get easily at every plant, and plenty of room under the staging for the reception of subjects for which a shady position is desirable, while provision for necessary ventilation is of the highest importance. Where there are flues or pipes for heating, kept warm by a properly placed fire outside, slated shelves may be fixed above for the accommodation of plants and young stuff needing bottom heat. Draughts must be most studiously avoided, and cleanliness strictly observed. Good, well-fitted joints in the woodwork, and neat glazing, preventing the ingress of rain, are essential. The management of a greenhouse is really a matter of practice and intelligent pursuit of well-weighted and attainable ends. To have bloom all the year round in a greenhouse there must be of course systematic selection of subjects. A few *Azaleas* to come on in May, large flowering pelargoniums to follow, then *fuchsias* and choice geraniums, variegated as well as green-leaved will supply the late spring and summer staple. *Heaths*, *Chrysanthemums*, *Primulas*, and a *Camellia* or two may make the main of a back-end and winter show. *Cinerarias*, *Liliums*, *Calceolarias*, *Cyclamens*, the *Deutzia*, *Everlastings*, a few fine *hyacinths*, a *myrtle* here and there, and some trainable blooming plants, like the *Lapageria*, *Plumbago*, *Abutilon*, and others, according to taste, may be taken up with, and if these be properly treated there will always be a gay greenhouse. For the rest, a following of the brief entries in this dictionary will be found to convey much that is suggestive and helpful to greenhouse beginners.

Guelder Rose.—A beautiful flowering shrub, with snowball-like bloom, propagated by suckers or by layers pegged down in spring. Prefers a sunny and open situation, and will grow in any good soil. The Japanese snowball tree (*Viburnum plicatum*) is a particularly handsome variety.

Guernsey Lily.—*Nerine Sarniensis*, an amaryllid with pale salmon flowers, not to be confounded with the *Belladonna Lily*. Bulbs may be had of the seedman early in August for immediate planting, and will grow and flower quickly in cocoa-nut fibre or rain water as well as in given good soil.

Hardy Annuals, Biennials, and Perennials. (See *Annuals*, *Biennials*, and *Perennials*.)

Heaths.—Small plants of the *Ericaceae* order from the Cape of Good Hope are obtainable at all nurseries, and make admirable greenhouse blooming subjects. They require good peat, broken up and intermixed with silver sand. In potting up great attention must be given to drainage, and the soil be very firmly rammed round the ball of each plant, and careful watering practised. If the plants are ever allowed to get dry at the roots, or on the other hand consistently over-watered, death will certainly ensue. Robust, bushy heaths should be chosen, and propagation obtained by cuttings of the tops of young shoots, inserted in shallow pots of well-moistened silver sand and kept over slight bottom-heat, these being closely covered with a bell-glass. The bell should only be removed to wipe away moisture from the interior until growth is perceptible, when air should be gradually given. When a good start has been achieved the glass should be taken away, and the plants potted off singly, and cultivated separately, never permitting drought at the roots, or there will be stunting and thickly set foliage. Charcoal with the drainage is good at each re-potting. Heaths are not good subjects for an amateur to grow.

Hedges.—Privet and laurel make good hedges, so do the taller growing box plants, the firethorn, arbor vitae, holly and quick combined, the yew, the hornbeam, or the common beech. All require topping and clipping carefully to secure good branching bottom growth. Plant straight, and not too thickly, to begin with, and leave room for air to act freely on the roots, preparing the ground by deep digging. Sweet brier is useful for the construction of low divisional hedges in the garden, if given moderate attention until fire and regular development be assured.

Heliopsis. (See *Sunflower*.)
Heliopsis.—Half-hardy annual, usually called the Everlasting Flower, various colours, one and a half feet high. Seed should be sown in March in gentle heat, the seedlings being later transplanted in sheltered borders. The flowers should be cut when young for preservation.

Hellebore.—The "Cherry Pie" is the fanciful popular name of this well-known and fragrant bedder and pot-plant. It can be grown from seed sown in gentle heat in February or a little later, and transplanted in light rich soil, or from cuttings taken in September and cultivated in cold frames like *calceolarias* in the winter. It is a capital pendent plant for ornamental baskets, window-boxes, or vases; or it can be trained for greenhouse or conservatory blooming by staking and tying. In the borders it should be pegged down and allowed room to run and spread. Before hedging out the hellebore needs hardening, as frost is fatal to it. Some greatly improved varieties have recently been introduced into cultivation, and seed of these can be obtained from all the leading nurserymen at a moderate price.

Hellebore. (See *Christmas Rose*.)
Herbaceous Plants.—This comprehensive term includes all low-growing vegetation, even when the plants throw up lengthy flower-stalks in their due season, but as a garden denomination it is usually associated with the flowering subjects, chiefly perennial, which find a place in permanent borders. Such a border intended for the accommodation of anemones, primroses, arabis, aubrietias, bulbs of many sorts, forget-me-nots, pansies, columbines, irises, dionysias, foxgloves, primulas, pink, pyrethrum, phloxes, gladioli, monardellas, marguerites, and many other beautiful blooming plants, should have careful and thorough preparation and after-tillage. It should be composed of good and nutritive soil, well-drained below, and be regularly and deeply manured. Preferably it should be wide, open, and sloping to south or west, with a wall or shrubbery behind. Discretion should be exercised in the planting, so that the dwarf subjects are to the fore, due regard being given to the flowering period of each. Superabundant growth must be checked by division at the proper time, and watering during drought not neglected.

Hibiscus Sinensis.—The "Chinese Rose," as this species is generally called, is a showy flowering shrub, which likes a light, sandy soil, and may be propagated by cuttings or by seed sowing. It will run up to ten or twelve feet high when once established.

Hippocrepis.—A genus of bulbous plants, including the Jacobaea and Barlaamias lilies, besides many pretty hybrids. Requires pot culture, in heavy rich loam, which should be treated with bone dust and powdered charcoal, and given free drainage. Propagated by offsets. Closely related to the amaryllis, with which it is sometimes confounded.

Holly.—The variegated and common green hollies are very decorative, and grow readily wherever there is room in strong or ordinary soil, not being injured by the smoke of towns. Once planted they are capable of looking after themselves, save in the matter of pruning, which should be done judiciously and to the encouragement of vigorous and symmetrical growth. Rows of ornamental holly make good screens in gardens for the protection of the tenderer subjects from northerly and easterly winds. Planting is best done early in May.

Hollyhock.—Hollyhocks propagate from short-jointed young shoots easily, but raising from seed is preferable, as the seedlings resist disease, to which this genus is very liable. Well selected seed can be placed in drills on a carefully prepared bed in April, so as to come up about an inch apart, covering with fine soil. Weed and water, and transplant without disturbing the roots when vigorous growth has begun, allowing ample space for development, and keeping off slugs and other injurious pests. In the second season stake, destroying all underbrashes when the flowers have shown, preserving only the choicest specimens, which cut down to about three inches high after flowering, and protect during the winter with litter after loosening the surrounding soil with a fork. The following year will furnish the finest bloom, from which seed

may be saved, and culture begun *de novo*. By watering with strong liquid manure during the growing period in dry weather, and pinching off laterals, very large flowers can be obtained from the carefully selected double sorts, and there are many of beautiful shades of colour, white, yellow, rose, red, and salmon.

Honeysuckle.—All the *Lonicera*s will strike readily from layered branches and cuttings taken during the growing period, or root divisions may be made. They are invaluable as trailers and wall and trellis climbers, and some are good greenhouse rambles, *Sempervirens* particularly so. Japonica, the small-leaved, variegated variety, is deservedly a favourite, and should be given a sunny position in the garden, and neatly trained or permitted to run over banks or stumps.

Honesty. (See *Lunaria*.)

Hotbeds. (See *Frames*.)

Hothouse. (See *Stove*.)

Hyacinths.—Anyone can grow these beautiful blooming bulbs, but not everyone is able to cultivate them to perfection. In the open garden the necessary procedure is simple. The soil should be well dug and manured, and the bulbs planted in October three inches deep and well surrounded with sand. When frost comes strew the beds with clean straw, easily removable in mild weather, and leave the rest to Nature. For pot culture, plant each bulb in a four-inch flower pot, or two or three if desired in correspondingly large pots, well drained and filled with a compost of fibrous loam, leaf soil, well rotted cow dung and silver sand, promoting root growth by covering the whole of the pot and bulbs six inches deep in ashes or cocoanut fibre until growth is well advanced, when gradually inure to light and take to a warm greenhouse or room to flower. Let the compost be rather rough and drain the pots thoroughly. The process may commence in September or October, and early bloom can be procured by careful forcing, aiming always at getting the pots full of root before upward growth is encouraged by light and air. Hyacinths may be cultivated in sand by dipping the vase or other receptacle containing the medium and the bulb in tepid rain water, or cocoanut refuse well mixed with charcoal well broken and powdered, is even better. They also grow nicely in china or other bowls filled with damp moss. The bulbs do well in glasses made for their growth if kept in a dark but not draughty or damp cupboard until the distilled or rain water beneath them, which should contain charcoal to keep it pure as long as possible, is well filled with roots. Then bring out into light and sun and keep clear of dust as the leaves and flowers and stem shoot up. Ripe sound bulbs should be selected, rather than loose large ones. The Roman and Italian Hyacinths flower the earliest.

Hydrangea.—A decorative half-hardy shrub from China, bearing very large trusses of pealy bloom, white to blue. Requires strong loam enriched, and plenty of water, weak soap-suds suiting it well. If left out in the winter it should be protected against frost. Partition of large clumps, or cuttings of half-ripe young shoots, after flowering, are the methods of increase. Hydrangeas make good tub plants for terraces or large conservatories, and will live for many years with a little care, cutting back after blooming, and top-dressing from time to time. They start well in a cool greenhouse, and like a little liquid manure or other fertiliser to help them along when the buds begin to appear.

Iceland Poppies. (See *Poppy*.)

Ice Plant.—This uncommon and attractive trailer, to which the florists give the lengthy name of *Mesembryanthemum crystallinum*, makes a good rock plant or hanging basket subject. It will flourish with a little trouble in the beginning, in any good soil, in a sunny situation. Sow seed in gentle heat in April, transplant to small pots and re-start growth, then turn out to harden, and finally set where wanted to remain, keeping down surrounding weeds. Some grow the ice plant for garnishing.

Impatiens.—A rather tender but handsome border plant, of the *barbata* tribe and curious because the seed vessel opens at a touch. Will easily propagate

itself by seeds when once the latter have been sown in the open. *Impatiens Sultan*, bright scarlet flowered, requires retaining in the greenhouse to bloom.

Indian Aloe. (See *China*.)

India Rubber Plant.—This capital parlour plant should be placed firmly in a pot, well-drained, of sufficient size, containing charcoal over the drainage, and filled with a compost of mellow sandy loam. It, once started, need only be watered when thoroughly dry, and that by immersion in rain or tepid water. It prefers a shady to a sunny window, and requires fresh air. Outdoor exposure is good for it in summer, and gentle sponging of the leaves to clear from dust keeps it healthy, with a careful shift to a larger pot, without disturbing the ball, when rootbound. Such treatment will carry this *Ficus* to large and handsome proportions. Cuttings of single-eyed shoots may be struck in sandy peat.

Indoor Decorative Plants.—The plant lover who does not possess a conservatory will often like to decorate his parlour or other dwelling-rooms with the choicest procurable plants, preferably of his own growing, and there are many subjects which lend themselves to this kind of display. In the spring, the hyacinth is available, and cinerarias, pelargoniums, calceolarias, begonias, and fuschias, among beautiful flowering plants, will keep up an indoor flower show over a lengthy period, while azaleas, primulas, and cyclamens, can be employed to brighten up the home. India rubber plants, small dracaenas, aspidistras, and numerous other foliage plants of moderate size may also be maintained in health at a minimum expenditure of trouble, as can many beautiful ferns, if kept out of direct sunlight and moist at the roots without stagnation. To this end, there must be systematic and sensible watering; just when each plant wants it, and aeration, as distinct from exposure to chills and draughts; also care to keep every growing thing below the level of gas jets. Plants for dinner-table decoration should be fresh and frequently renewed, brought in from the greenhouse or frame in their full beauty, and replaced when not in use or past their best, the pots in which they are growing being inserted into the larger ornamental vessels as command for the time being, and the surface soil covered neatly with damp moss. There is scope here for the exercise of great taste, and much can be accomplished with comparatively limited resources and intelligent attention.

Ipomoea Purpurea.—The "Morning Glory" of American verandas, a very useful climber, which goes prettily with the light leaves and yellow blossom of the canary creeper, when the two are permitted to intertwine on trellises. This *Ipomoea* has convolvulus-like flowers of various colours—purple, pink, crimson, white, and blue, and large heart-shaped leaves, and will ramble to a height of ten feet or so. It likes a light soil, and being half-hardy, should be raised from seed over a gentle hotbed in March, and planted out in May.

Iris.—Long-running, tuberous- or bulbous-rooted, hardy herbaceous plants bearing flowers of rich and varied beauty, some of them vying with the Cattleyas, *Lælias*, and other exotic Orchidaceæ in grandeur, and most are of peculiarly easy cultivation. White, yellow, purple, brown, with much variety of delicate veining, and blotching in some cases, the *Iris*es are universal favourites. The three upper and inner petals of the flowers are erect, the lower three drooping and generally reflexed. The German section is the more common and includes the yellow *Iris* or water-flag and the larger flowered purple and lilac, yellow-bearded Germanicas, which does so well in town gardens, and puts up stems to a feet high. The Spanish and English sorts are smaller, comprise greater diversity of colouration and pencilling, and are bulbous-rooted. *Iris*es are best planted in clumps for effect, and flourish in light, rich garden soil, making admirable subjects for a shrubby border. Propagation by division of the roots is accomplished with facility after flowering, and rather stronger soil and a shadier position than that accorded to the English and German varieties suit the Spanish sorts.

Isamee (Hymenocallis) Calathinum.—The Peruvian Daffodil, a sweet-scented, summer blooming,

bulbous-rooted plant, with large white, cup-shaped flowers, grows nicely on a south border, and makes a good subject for indoor display. Should be given light loam and leaf soil, rather rich, and ample drainage, and when planted outside, taken up in winter for rest and protection.

Ivy.—All the *Hedera*s are invaluable for growing on unsightly walls, and are most accommodating as to situation and soil, and some of them look very pretty, especially the smaller-leaved, close-clinging and variegated sorts. *Hedera Helix Canariensis*, the Irish Ivy, is a very quick grower, and soon covers a screen. It should be clipped closely in March. Donnell's Ivy and *Hedera atropurpurea* are particularly attractive and graceful subjects, so are also *Helix foliis argenteis* and *foliis aureis*, the silver and gold Ivies. Slips root readily in sandy soil in springtime in a shady position, if gently watered during dry weather.

Ixia.—A graceful Cape bulb, with long slender flower stalks, will succeed on a sunny outdoor border, but very suitable for the greenhouse if potted in autumn. May be raised from seed sown in September in light loam, in a cold frame. Peat or leaf mould should be liberally mixed with loam for the after culture of the *Ixia*.

Jacobaea.—The American groundsel, a gray and blooming annual, good for ribbon effects in the border, carrying crimson, blue, or purple bloom, and easily raised from seed or by cuttings, treated as those of the verbenas.

Jacob's Ladder.—A hardy, herbaceous plant, emitting a disagreeable odour, but possessing pretty fern-like foliage, and bearing showy blue flowers. The silver variegated variety, *Polemonium coeruleum variegatum*, makes a good decorative pot plant, or may be utilised as a bedder, in rows or otherwise, being easily propagated by root division if firmly planted in any light soil, and well watered at the beginning. Its leaves are medicinally used in many places as a poultice ingredient in ulcerous ailments.

Japanese Anemone. (See *Anemone*.)

Japanese Primula. (See *Primula*.)

Jessamine.—Fragrant, free flowering, and rambling shrubs, which may be trained as climbers or treated as trailers. The common white *Jessamine*, or *Jessamine*, is particularly attractive and powerfully perfumed. Nudiflorum, a yellow-bloomed variety, flowers in winter on the naked stems. There are sorts which require greenhouse culture, and are exceptionally beautiful. All may be raised from cuttings in sandy soil, started under a bell-glass.

Jonquil.—Hardy bulbs of the Narcissus order, very fragrant, flowering and elegant. Will last for years. Left alone out of doors if the old leaves are not cut away, and can be potted up for greenhouse and conservatory decoration, half a dozen in a pot. Both the doubles and singles propagate readily by division in September, and their yellow blooms are always attractive.

Kalocanthos.—Properly called *crassula*, this plant belongs to the house-leek order, and flowers in May, making a good rockery subject. It luxuriates in a mixture of sandy loam and brick rubbish, and is increased by cuttings and offsets. The white flowers, of jasmine-like formation, become suffused with red as they fade.

Lathyrum.—The graceful tree *cytissus*, whose golden tassels of butterfly-shaped bloom are so attractive and familiar in spring time, grows beautifully and steadily in any garden where afforded room, and can be raised from seed without trouble. The leguminous seeds are narcotic and poisonous to many animals, and very dangerous to children.

Lantana.—A capital genus of conservatory blooming shrubs, some sorts of which come in well for summer bedding. They are half-hardy perennials, in fact, and carry thick crowns of tiny verbenas-shaped flowers in endless gradations of delicate colour shade. In warm, dry ground, light and rich, they do best out of doors, and come from March sown seed in heat or cuttings taken in autumn. Must have winter protection in Britain.

Lapageria.—A handsome Patagonian evergreen

plant of climbing habit, requiring cool greenhouse culture, and may be trained on a balloon trellis effectively as a conservatory specimen, or round a pillar or on a back wall where the light has free play. They want rich sandy loam mixed well with peat, as a compost. They must have plenty of drainage, and need a lot of water. Their beautiful bell-shaped bloom, waxy white or rose, is very distinctive. Layering, at the growing period, affords the readiest method of propagation, but they may be grown by seeding in heat. *Lapagerias* are liable to insect attacks in spring, and must be kept scrupulously clean.

Larkspur. (See *Delphinium*).

Lathyrus.—The sweet pea. Of the perennial description there are several strong growing varieties, rosy-pink, red, and white flowered, all old favourites for trellises or fences, propagated from seed or root division. They are useful for bouquets and table decoration, and should have the seed pods picked off if continuous bloom is desired. The annual sorts, now vastly improved and innumerable in variety, are referred to under the heading "*Sweet Pea*."

Laurestinus.—Belongs to the *Viburnum* family, which includes the Cuscuter rose, or Snowball tree, but is an evergreen. Bears clusters of pinkish-white bloom in winter and spring. Succeeds in deep sandy loam, and prefers a sheltered situation. Small shrubs make good subjects for window decoration. Increased by suckers or spring layering.

Lavender.—*Lavendula vera*, so much favoured as an old garden subject, and cultivated extensively for perfume production, is best propagated by autumn struck cuttings, which should be put in light soil under glass, or may be increased by transplanting offsets. Straggling shoots should be pruned in spring where shapely bushes are desired. April is the time to plant out, either the white, or more familiar and typical lavender-coloured blooming sorts. Flowers for preservation should be gathered on a dry day, and not before they are fully opened and brown.

Lavender.

Leaf Mould. (See *Soil*).

Lemon Plant.—A greenhouse shrub with scented foliage, propagated by cuttings taken from young April growth. Use sandy soil to start, over heat, repotting into stronger and richer mould. Must never be exposed to frost.

Leucojum.—Hardy bulbs with flowers of snowdrop shape, but very considerably larger in size. The variety *verum*, the Spring Snowflake, flowers naturally in March, and may be forced for window show earlier. The Summer Snowflake is a May bloomer. Both are very hardy and can be grown in clumps in ordinary soil.

Lilac.—Though they will grow anywhere, the syringas are shrubs which pay for planting in good, deep, dry soil. The flowering shoots should be shortened about midsummer. There are attractive cultivated varieties of the syringas, both white and reddish-purple, and double Persian and Chinese, bluish pink and white as the typical shade. The latter, especially the white flowering form, are much forced as pot plants in frames by the market gardeners, but should only be so treated for one season, or at any rate not in two successive years.

Lilium.—No British garden or greenhouse without lilies can be considered complete, though the lily is not a British bulb at all. However, the lovely old white candidum has been cultivated in our gardens for over 300 years, as has also the scarlet chalcidonicum, or Turk's cap. Varieties of these should always be given outdoor treatment. So should the orange lily (coccineum) and the Martagon sorts, all of which are very effective in borders. Light or medium soils want well digging for their reception, with the incorporation of plenty of well rotted manure, and very heavy land is not suitable for lily growing at all. When the bulbs are planted in early autumn they are best surrounded by sand to save them from damping off before root growth has been established, and the clumps should not be disturbed for 3 years at least, though top-dressing of leaf-soil and manure may be lightly forked in with advantage in early spring. The bulbs may be put 5 or 6 inches under the surface, firmly pressed

upon sand, and for the first winter lightly covered with litter during extreme frost. A better plan still is to start the root growth in pots before planting out. For indoor culture the *Lancifolium* varieties, album, roseum, and rubrum, are grand, so are *Longifolium punctatum* and *astroangulatum maculatum*, besides the *Harford*, *Brownii*, *parvum superbum*, *giganteum*, *cordatum*, and gorgeous golden-rayed Japanese nomenclature. Leaf-soil rough and half decomposed, with mellow loam, some peat and plenty of river sand, mixed with wood ashes, makes a good general compost for the pot culture of lilies, which should be given extra liberal drainage, and a layer of charcoal over the crocks, planting the bulbs tightly an inch below the top of the soil. Sand is a good thing to cover the crown of the bulbs with, and if they be plunged, pots and all, in ashes or coconut refuse, tan, or leaf-soil to begin with, all the better. They may be kept dormant in a cold frame or under the greenhouse stage during winter, out of the reach of frost and water drips, repotted and grown on in spring, and placed in the greenhouse or conservatory, or turned out of doors altogether to bloom in summer. Sinking the pots of the choicer sorts in shady garden borders, the flower stalks securely staked, is a capital plan, and in the actual flowering stage they make splendid room plants. Water should be administered very sparingly until vigorous growth has begun, many promising auratum and other fine lilliums having been ruined by premature soaking. If the pots at planting be but three-quarters filled, top dressing with peat, sand, and rich leaf soil will help as the flower stalks shoot up. The choicer bulbs should be preferred, very loose-soiled ones not being so satisfactory even if of larger size than those of sound healthy development.

Lily of the Valley.—Thoroughly British lilies of the valley are not lilies at all, but *convallaria*. Propagation is best achieved by division of the root clumps, which should be planted in a shady and moist but well-lighted situation in good soil, containing a large proportion of leaf mould and some well-rotted manure. Place the clumps a foot apart. They do well in pots for out of season blooming in the greenhouse if retarded crowns are secured.

Linum.—Graceful annuals or perennials; flaxum (the yellow flax) and grandifolium (rosy crimson) are both under a foot.

Loam. (See *Soil*).

Lobelia.—An invaluable plant for dwarf bedding purposes, making an admirable subject for the front of borders or window boxes. Grows readily from seed, cuttings, or root division. The blues, speciosa compactum Paxtonii, and others are most in vogue, and there are some pretty white sorts. Gracilis, bushy, is a fine pot subject; erinus, a trailer, does well for hanging baskets and vases, drooping elegantly over the edge; while there are tall varieties, including cardinalis, bearing scarlet blossoms. Some particularly pretty doubles are now to be had also, less free of growth however, than the type, and requiring more care in cultivation.

Loose Tree. (See *Monarda*).

Lomandra. (See *Monaysuckia*).

London Pride. (See *Saxifraga*).

Lotus.—The bird's-foot trefoil, a hardy rock-work plant of dwarf, spreading habit, delighting in dry, sandy soil, and readily grown from seed. The common sort bears bright yellow blossom. Lotus Australia has rose spikes, and the variety Jacobus is a greenhouse perennial, purple flowered.

Love-in-a-Mist.—Dark, violet-blossomed annual, very peculiar foliage, 18 inches.

Love-Lies-Bleeding. (See *Amaranthus*).

Lunaria. Biennial. A pretty deep-violet flowering garden biennial, making 18-inch long leaf stems, the seed pods being serviceable for decorative purposes.

Lupin.—A free-flowering garden genus, annual or perennial, carrying long and stately spikes of bloom above robust and graceful undergrowth. Raised from seed, and increased by root division. There are various shades of white, yellow, and blue lupin, the seeds of the white sort being regarded as a highly

nutritious succulent food in some European countries. Indigenous to the Mediterranean shores and temperate Asia.

Lychnis.—*Lychnis chalcedonica* is a useful garden perennial, producing large heads of brilliant scarlet bloom in July. Good soil gives splendid results. May be put out in the border in spring and autumn when the plants part up well. "Ragged Robin" is the British meadow lychnis, and the Corn Cockle and Campion belong to the genus. The double-flowered cultivated varieties may be propagated by cuttings from side-shoots taken in June.

Lycopodium (*Selaginellus*).—An order of pretty, flowerless creepers, popularly known as club-mosses, many of the species being variegated. They grow well in ferneries and the shadier situations of the greenhouse, and spread with rapidity.

Madwort, Book. (See *Alyssum*.)

Michaelmas Daisy. (See *Alyssum*.) or perennial aster, are all vigorous subjects, and gross feeders. Multitudinous as to variety, the genus comprises almost every floral colour, and subjects of heights ranging from 2 to 5 feet, blooming between August and December. They spread rapidly, and should be cut up and replanted each second year, in spring time for preference, though autumn will serve, destroying the central part of the old stools. The Michaelmas daisies rank amongst the best of town grown hardy perennials.

Mignonette.—Of this fragrant favourite there are endless varieties, all of them thriving best in an open situation. Seed may be sown early under glass for transplantation, which must be carefully done with as little root disturbance as possible, or scattered about on borders anywhere where the sun shines, in April or May. Light soil containing calcareous ingredients suits mignonette admirably, and if it be prepared beforehand by manuring well, and the plants are thinned out and watered copiously during drought, splendid results will be achieved. It is a good window plant, indoors or out, and the giant mignonette is an attractive conservatory subject.

Mimosa. (See *Aconit*.)

Mimulus.—The "Monkey Flowers" are handsome perennials, bearing large flowers in which bright yellow coloration predominates, often splashed and spotted with brown, chocolate, or coppery red. *Mimulus moschat* is the common and pungently odorous musk, which delights in shade and moist warmth, Harrisoni being a large flowered variety. The minute seed should be scattered thinly and very slightly covered, and starts growth best in gentle heat. *Mimulus* seed sown in spring makes fine plants for summer bedding; autumn sown seed will produce early flowering plants for indoor embellishment. There is a double-flowered "hose-in-hose" *mimulus*, luteus nobilis by name, which some people prefer before all others on account of its curious formation. Rich soil should be employed, inclining to lightness, and plentiful watering is essential to their successful cultivation and management. All these plants are easily propagated by cuttings.

Moneywort.—The pretty trailer more commonly known as "Creeping Jenny," the botanical name of which is *Lysimachia nummularia*. Its long strings of loose-lying yellow flowers fancifully supposed to resemble rows of small gold coin, gained it the popular title of moneywort. Propagated by division, will grow almost anywhere, and is very useful as a hanging basket subject. Likes plenty of moisture at the roots.

Monkey Puzzle. (See *Arancaria*.)

Monk's Hood. (See *Aconit*.)

Montbretia.—A bulbous and distinctly beautiful subject, akin to the wild gladiolus as to root appearance and foliage, and requiring similar culture. The flowers are grown on gracefully branching stems, and are usually deep scarlet, suffused with yellow. *Montbretia* should be planted in a warm border in October, in rich yet light, sandy loam, with an admixture of leaf soil, about two inches apart and three inches deep, being covered with litter until March, when a mulching of short manure, preferably from an old hot bed, may be substituted. *Montbretia* like

plenty of water, especially in summer time, to prevent the leaf blades from browning at the tips. With ordinary treatment they spread rapidly, and should be divided and transplanted in late autumn, when they will afford a splendid display during the succeeding summer. The long slender branches of bloom, which keep well after cutting, come in admirably few bouquets and dinner table decoration placed in glasses with asparagus fern, maiden-hair, or other light greenery.

Morning Glory. (See *Ipomoea*.)

Moutanba Plant.—A pale-blue blossomed late-flowering shrub (*Caryopteris mastacanthus*) with prettily alivered under leaves, reaching 3 feet high, thrives in a sunny sheltered border in any good soil.

Mullein.—A flowering perennial or biennial border subject, botanically called *verbascum*, carrying erect spikes of showy bloom. *Phacelia*, 2 to 3 feet, has purple rose or white flowers, according to variety, formosum, 6 feet, dense pyramidal golden yellow olympicum, which should be treated as a biennial, bears branching yellow bloom. The plant has valuable medicinal properties, and may be raised from seed sown in spring in light soil, and transplanted before placing in its final position in the April following. Propagation of the perennial sorts may be successfully practised by division in spring or autumn.

Muscari.—Dwarf spring flowering bulbs of the hyacinth order easily cultivated in good garden soil. *Muscari moschatum* has vivid greenish spikes, musk-scented, botryoides (the grape hyacinth) is smaller and very attractive, with blue and white bloom; monstrosum (the feather hyacinth) has feather-like flowers; conicum, blue, is bright, beautiful and free growing. Should be planted out in September, and dealt with thereafter as advised for bedding hyacinths.

Musk. (See *Mimulus*.)

Myosotis. (See *Forget-me-not*.)

Myrtle.—A desirable half-hardy evergreen shrub, usually given greenhouse treatment, but amenable to outdoor culture in a sheltered, sun-warmed situation in this country. Should be well syringed when kept under glass, and grown in loam and leaf-mould well mixed with sharp sand. Strikes readily from growing shoots in light soil. Likes moisture, but should be guarded against frost. Its pretty white blossoms, and glossy green fragrant foliage make the myrtle very popular for conservatory and parlour window decoration.

Narcissus.—This tribe of hardy spring flowering favourites includes all the daffodils and jonquils. The bulbs may be treated as hyacinths for pot and general indoor blooming, and by planting them at intervals between the beginning of September and Christmas, a long succession of floral beauty may be provided. Either singly or several in a pot, they produce a pretty effect. Out of doors they are best planted first in well-drained and sheltered borders in September deeper than the hyacinth, say 5 inches down, and the beds lightly covered with dry leaves or litter. Good sandy loam grows the narcissus nicely, and they may remain undisturbed for three seasons with advantage, except where the soil is poverty stricken, when transplantation to a fresh position will help matters. The polyanthus sorts, though large of bulb, are the least robust, and the poeticus varieties should be planted or transplanted, as the case may be, as a rule, earlier than the rest.

Nasturtium. (See *Tropaeolum*.)

Nemesia.—An effective half-hardy annual, a little over a foot high, carrying a profusion of bright, orange, crimson, or scarlet bloom, sometimes showily blotched. Good for bedding masses or for mixing with other border subjects. Sow seed in heat in January, pot the young plants off singly, harden off, and plant out at the end of May.

Nemophila.—A neat, dwarf-growing floriferous border annual, particularly suitable for the front of the bed. They are propagated readily from seed sown thinly in drills where blooming is desired. *Isignis* is a pretty and compact spreader, white eye and sky blue, and maculata blotched purple on white is robust and larger flowered. *Phaceloides*, blue and white, is a perennial, and may be divided for increase, but the

varieties of insignia, of which the seedsmen offer many, are the best to employ for ribbining or masses, insignia grandiflora being recommended. Seed sown in August will bring about an early summer display, that got in on good soil in April comes on a little later and is perhaps the surer. Thin out to allow every plant room for free expansion. Cats always roll on this plant.

Nicotiana. (See Tobacco Plant.)

Trifolium. (See Clover in Mist.)

Wile Lilies. (See Arum.)

Oenothera. (See Evening Primrose.)

Oleander (Nerium oleander).—A handsome, tough-leaved, greenhouse shrub, bearing pink or white semi-double bloom. Should be grown in peaty loam and sand, and kept plentifully watered, the foliage being frequently sponged to ward off the brown scale attacks to which the genus is subject. Ripe shoots may be struck if root growth be started by immersion in rain water exposed to the sun. The flowers and shoots of the Nerium, the proper botanical name of the oleander, are both poisonous. It flourishes out-of-doors along the Mediterranean, and may be stood in sunny shelter on south-facing terraces in this country with safety when matured in pots if frost be guarded against.

Oleandra Haastii.—A box-like evergreen, sometimes called the "Bush Daisy," suitable for growth in a sheltered town garden for ledge ornamental purposes. Reaches a height of 5 feet, and produces fragrant white flowers. It grows well in loamy soil, and may be clipped neatly in spring or autumn without injury if discretion be displayed.

Orchids.—The growth of tropical orchids is a thing for the expert only with "all appliances and means to boot," which include a well-planned and appointed hothouse or stove. But many beautiful orchids from the Cape of Good Hope and sub-tropical or temperate regions may be successfully cultivated in an ordinary greenhouse, if intelligently treated; but there are some charming species hailing from Southern Europe, which require but slight protection in this country against winter rigour. Therefore, almost everyone who wishes may venture to some extent upon orchid-culture without fear of absolute failure. The terrestrial, or ground-inhabiting, orchids present least difficulty to the novice, and many of the cypripediums and other attractive groups may be dealt with in a manner entailing comparatively little trouble beyond the employment of a plentiful admixture of good peat and clean silver sand and charcoal dust with the potting compost, proper attention to watering during the growing period, and the provision of particularly complete drainage in extra clean pots of suitable size for the subject. Most of them flourish best in maintained humidity, with steadiness of genial temperature and freedom from draught, ventilation being given near the pipes. Overheating and atmospheric fluctuation must be sedulously avoided. A large range of orchids succeed where palms and the more delicate ferns flourish, and the combination always has a pleasing effect. An even winter warmth of 45 degrees and 60 in summer suffices for the healthy development of numerous lovely species from South America and the mountain districts of India, such as the masdevallias, lycastes, and odontoglossums, besides many of the oncidiums and others of the epiphytes, or tree-growing species, all of which must have management according to their natural need. Proper perforated pots, pans, or open teak baskets should be employed, or the plants may be secured to clean porous and undecaying wood blocks or pieces of tree-fern trunk. All these requisites may be obtained from the florist's without niggardly, and living sphagnum moss and specially selected fibrous peat are also readily procurable for use in lieu of soil where the species suits on air and moisture alone. Practical advice should be sought by beginners from a professional gardener well up in this fascinating branch of horticulture, and a good manual on the subject studied, when it will be found that it is possible to compass much with limited resources in a direction not always confidently adventured upon.

Oxalis.—Bulbous plants well adapted for rock-work and border growth, also for pot culture, their fresh

green foliage contrasting finely with the rich blossoms. *Oxalis floribunda*, with rosy-coloured flowers, is a good garden variety which will thrive in any light soil. *Oxalis acetosella* is the white, purple-veined, wild wood sorrel, which folds its flowers at night or under the influence of the hot sun.

Paeony.—Herbaceous paeonies are very hardy, so also are the larger shrubby section, sometimes called tree paeonies; the latter, in a very severe British winter, require slight protection. They will take up a great deal of nourishment, and should be planted in strong, deep, rich loam, into which a quantity of rotten cow-dung has been dug. They throw up above their large ornamental foliage great globular blooms of rich hues, crimson, rose, salmon, blush, and also pure white. A shady situation, yet open, suits them best, as strong sunlight will often cause the flowers to fade, and watering with weak manure decoction assists development. Some of the Chinese paeonies exude a peculiar perfume. They propagate by division after flowering, or from cuttings carefully layered, and can also be raised from seed, but the young plants will not usually flower for 5 or 6 years. Some white flowered varieties have sulphur or other tinted centre petals, and almost every season produce new hybrids. There are European paeonies with single flowers of great colour, but unlike those of the water-lily. Any of the tribe look well on large lawns, or in front of shrubberies.

Palms.—Many graceful palms flourish and endure for a lengthy period in full beauty in the greenhouse and conservatory, or as subjects for room decoration, and a goodly number will stand well out of doors in our climate with a little care in all but the severest weather. *Phoenix sylvestris* is one of these, and the variety *dactylifera* (the Date Palm) is easily managed. *Cocco Weddelliana*, which likes the shade; *Latania Borbonica* (the Fan Palm); *Araucaria excelsa*, *Kenedia Fosteriana*, the dwarf-keeping *Chamaerops humilis*, and *Geonoma gracilis*, *Rhapis flabelliformis*, and the Chilean *Jubaea spectabilis*, are all ornamental and easy to deal with. Inexpensive when young, they make handsome table plants, and most of them may be grown on by judicious shifts and outdoor hardening to a considerable size. They do not require large pots, comparatively speaking, at any stage, but should be very firmly planted, over ample drainage, when they will absorb any amount of root watering within reason, a good compost being fibrous loam, peat, and leaf soil in about equal proportions, with plenty of sharp sand.

Pansy.—The pansy, as we know it, large, rich, and beautiful, is what the florists have made it, from the basis of the viola, or wild pansy, of bank and hedge-bottom. There are two types, the British Heartsease, or show sort, with the variant colour patch round the small eye; and the Belgian, or fancy division, having the "blotch" as large as possible. The former type is sub-divided into selfs of almost every hue, white grounds and yellow grounds, and each class possesses an endless and ever increasing variety. The two top petals of the flower in both types should be of even coloration, correspondent with the belt surrounding the ground colour on the bottom petals, and in some of the darker British show selfs there is no discernible blotch. Propagation of the choicest named pansies is by cuttings, for seedlings are apt to vary widely from the parent; though packets of seeds saved from the finest and most perfect flowers of every variety are pretty certain to produce some very satisfactory plants. Sowing should be done immediately following blooming for display in the succeeding spring, or in April for autumn flowering. Fibrous loam three parts, leaf mould two parts, and some clean sharp sand, forms a serviceable pansy compost, and this should for beds, be placed at least 4 inches thick over a well-dug and drained subsoil to get fine bloom. Pot plants must be well crocked and carefully watered.

Papaver. (See Poppy.)

Passion Flower.—This interesting and very peculiar-flowered climber is usually reckoned a greenhouse or conservatory subject, but the variety *cerealis* will train up a sunny south wall in a sheltered spot out of doors, and do well in any good light soil. For pot culture, wound round a trellis or a pillar, it requires plenty of drainage. Cuttings should be taken with a heel, young

short shoots, and put into single pots of light, sandy compost in a close frame or under a glass to strike. Not only the blue sort, best known, and others like it may be grown easily in the greenhouse, but the rarer red coccineas and some white sorts, among which "Constance Elliott" is perhaps the best obtainable. The fruit of the *Pasiflora* looks pretty on the plant, and that of *P. edulis* is considerably delicate.

Pea, Sweet. (See *Sweet Pea*.)

Pea, (See Heli.)

Peat. (See *Heli*.)

Peatgarden. (See *Geranium*.)

Pentstemon.—Pentstemons like a peaty soil or rather heavy loam, particularly if it be well worked and efficiently drained. The hardy species contains a wide range of variety as to colour and habit. They are propagated from cuttings, or from seed sown in gentle heat in March, and transplanted after previous pricking out in a cold frame, to the blooming bed in May. Some of the choice florist sorts of pentstemon almost rival the *gloxinia* in beauty of bloom, and these should be raised from June-sown seed, grown on and sheltered over the winter for spring planting, being treated as half-hardy perennials. The cuttings are treated the same as those of *catananches* (which see).

Perennials. **Hardy.**—This term includes all plants which will winter out of doors and do not require renewal from seed annually or at most biennially. It therefore comprises most of the border subjects of a British garden, both those which die down to the ground in autumn or winter to re-appear the next season, and those which remain evergreen such as the carnation and the saxifrage. The principal varieties of both classes will be found fully dealt with *seriatim* in this dictionary.

Perilla.—A very useful annual for ornamental bedding purposes. *Perilla Nankinensis* may be raised from seed sown in gentle heat in March, the seedlings being pricked out in a cool frame subsequently, and planted in the garden beds at the end of May. Its foliage is deep maroon, almost black in some cases, and it carries a pink bloom, which may be pinched off to maintain the full force of the colour effect of the dark leaves in ribboning work if necessary. It grows to a foot or 18 inches high.

Periwinkle.—An evergreen trailer, sweet-scented, bearing pale blue flowers in springtime, and of rapid growth. Likes a moist shady situation and light soil. Propagated with facility by root division.

Pests of the Garden.—Snails and slugs are among the most destructive of the gardener's enemies. Cleanliness and the removal of the harbourage of these marauders is essential. Flower pots left lying in moist shady places, decaying vegetation, and rubbish of every description, afford shelter to shell snails which creep from under cover nightly to play havoc with young plant growth. All such hiding places should be abolished as far as possible, and irreparable concealment positions thoroughly explored by daylight, the pests being captured and killed, while persistent nightly searches must be made by the aid of a lantern or candle at planting-out time for both snails and slugs on the prowl. Throw them into an old pail containing a little water made strongly saline whilst warm; this will quickly kill them all. Lime sprinkled round seedlings and tender transplanted subjects impedes the small fry until wet has exhausted its fire, and they may be trapped by laying about cabbage or lettuce leaves and then made an end of. The "leather jacket" or "daddy-long-legs" larva do a lot of damage by eating through the stems of carnations and other juicy plants just below the surface, mainly by night. They keep close to their food, and should be searched for assiduously where suspected and destroyed at sight, whilst starlings and other birds which come insect hunting should never be scared away. Catch the wire-worm pest in pieces of carrot stick into pansy and pink beds, and keep the hoe stirring in the sunshine to turn out all evil things that infest the garden, so that you or your friends the birds may sacrifice them. Entice earwigs into hay in small pots inverted on flower stalks, shaking them into scalding water. Get a few toads to help you to keep wood-lice under, especially in frames. If the reptiles are thin and active on receipt, they will soon be fat and sleepy, and many

insects will have perished in effecting the change. Handpick and slay every ravenous creeping vegetarian you can find, looking most closely for a caterpillar that is generally endowed with protective mimicry. Throw the finest dry dust over the leaves of anything the turnip flea and his congeners attack, doing this when the leaves are damp. Hunt out the little brown grub that rolls himself in young rose leaves, and commit him and his shelter to the flames. Syringe every evening every plant, bush or climber, that any of the green flies or other aphides have got at, giving them, if you like, a dose first of weak tobacco water. Permit red spiders, the smallest microscopic thrips, and all the rest of the tiny eaters of leaf substance no peace, squirting at them often in early morning and dewy eve under where they are seeking a lodgment and maintenance. Encourage the ladybird, the eater up of these. When the insectivorous rascals get out of range amongst stuff that is forcing in frames or plant houses, it may be necessary to fumigate; then do the smoking with discretion, yet thoroughly. Mildew will go where cold draughts prevail. Then use flowers of sulphur on all affected parts. Proceed with cultural assiduity to keep your botanical belongings in robust condition, and you will not be overtroubled by the multitudinous pests which are always springing into life to prey upon sickly subjects that cannot resist their attack. There are also bigger pests, more difficult to circumvent if they get into a garden on mischief bent, cats, dogs, mice, moles, fowls, and even children not in sympathy with horticulture. Keep them out.

Petunia.—A half-hardy, soft-wooded, profusely flowering subject of great utility as a bedder and greenhouse or window blooming plant, luxuriating in a compost of rich fibrous loam with leaf soil to the extent of one-third, decayed cow droppings one-sixth, and sharp sand one-sixth. Sow in well-drained shallow pans, lightly sprinkling the seed with fine soil, and keeping close to the glass in a cool frame in April. Transplant the seedlings into single pots, grow on, watering freely, and pinching back to promote bushy growth, being gradually hardening as it proceeds. Peg down the longer shoots when in the borders, when the plants will throw up new growth bearing many flowers. Cuttings taken in August and put in light soil on a shady border will root readily, and may be transplanted to pots to shelter during the winter and bloom early in the following year. Petunias are fond of weak manure, and plentiful syringing, avoiding injury to the flowers, will keep down insect pests. There are many handsome sorts, both single and double, and great diversity of colour. In winter they must be kept fairly dry, and have plenty of air. Should mildew appear during the rest period a dusting with sulphur is advisable.

Phacelia Campanularia.—The Bell-Flowered *Whitlavia* (which see).

Phlox.—Phloxes are magnificent garden plants, both the perennial and the half-hardy annual Drummond variety. Their great trusses of delicate discoloured bloom, of many hues, always compel admiration, and the flowering period is lengthy. They require rich soil, deeply drained, and make large masses of matted root growth near the surface, so should be kept copiously watered and mulched with soft manure during dry weather. The perennials part readily when new growth is commencing, and cuttings may be made in spring and struck in sandy soil in a warm shady spot. The early flowering pyramidal section comes into full beauty in early June, while the decussate varieties of the perennial division are at their best a full month later. The annual Drummondii *Phloxes* should be raised from seed sown in gentle heat in March, and planted out in May in good soil, when they will make a grand display. They reach a foot high, and may be sown safely out of doors in the blooming bed, thinly, in April.

Physalis Franchetii.—"The Chinese lantern," a species of winter cherry, well worth cultivation for the decorative properties of its pretty calyxes and fruits, which last long indoors when gathered in the autumn. A rather poor soil suits this subject, which may be divided at the roots in spring and transplanted.

Piotee.—These very pretty perennials require exactly similar treatment, both for pit and bedding

culture, to their near relations, the carnations, from which they are distinguished by a narrow edging of dark coloration on the flower peaks, varying in shade from rose to scarlet or purple, and in breadth from a mere line to an eighth of an inch. The more even and distinct the marking, the more plicates are esteemed. They require particular care in keeping free from wireworm attacks.

Pink.—Garden pinks are no less acceptable than their lordlier congeners, the carnations, because of their sweet exhalations of perfume and robust and spreading growth. They propagate by root division as well as from seed and by pipings and cuttings, and make a delightful edging subject. There are laced and fringed varieties galore of the old-fashioned type, with a variety of coloration, white, however, being predominant, and even the single sorts are attractive. The florists have raised some very handsome, free-blooming, large-flowered pinks, among which *Her Majesty* and *Mrs. Sinkins* may be mentioned as specially excellent in all respects. All the pinks like a good rich loam to grow in, with which decayed cow-manure may advantageously have incorporation.

Plumbago.—A genus of climbing perennials, with flowers not unlike open blossoms of the *phlox* tribe, some varieties of pretty and delicate shades of blue, pink, and purple, and in cases quite white. The variety *capensis*, light lavender hue, is much favoured for training round pillars or along the rafters of green-houses. Rich, fibrous loam, with peat and sand, suits the plumbago, and it can be propagated by cuttings and rooting offshoots.

Polemonium.—(See *Jacob's Ladder*.)

Polyanthus.—The bunch-flowered garden primula, supposed to have originated in a cross between the cowslip and primrose. There are gold-laced, fancy, and hose-in-hose sections all readily raised from seed or root division, and each containing numerous varieties. They flourish in rich light soil and an airy situation, and young plants prefer shade from strong sun. Seed should be sown in summer, and the seedlings pricked off for later transplantation to commence blooming the following year. Clumps should not be allowed to remain unpurged more than three years or the flowers will deteriorate. The colours vary from white, through cream and peaty blue to scarlet, maroon, and nearly black, and from golden-yellow to deep brown, some having several shades of colour in combination, while there are doubles as well as singles.

Polygonatum.—A genus of herbaceous perennials, which include the feathery "*Solomon's Seal*," with distinctive pendulous green and white flowers at the leaf axils. Likes shade and soft good soil, and may be increased by root division.

Poppy.—The Papavers are a numerous family, light and graceful generally, pretty of foliage, and bright if evanescent of bloom. The satiny Shirley poppies, white, rose, and crimson, are capital summer bedders, and should be sown thinly in March on the borders and again in September for early bloom the following season, allowing each plant plenty of room to develop. They like light soil, and glory in sunlight. Other attractive annual varieties are the *Mikado* section, with fringed petals, the brilliant scarlet tulip, the carnation-flowered, the double-peony flowered, and the *Danebrog* or *Victoria Cross*, white or scarlet. Of the perennials, the Iceland poppies and the Oriental species, orange, red, or silvery, often with black centres, are great favourites; while the hairy sulphur and blue Himalayan sorts are, properly speaking, biennials, and should be so treated. They need watering at the root freely in summer. The elegant little Alpine poppies—rose, salmon, buff, orange, pale yellow, and white, are gems for the rock garden.

Portulaca.—The "*Sun Plant*," a large and brilliantly flowered yet dwarf growing half-hardy annual, delighting in a hot, dry situation. Best sown where it is to flower the end of April or early in May.

Potentilla.—A genus of herbaceous perennials, the smaller varieties of which resemble the wild strawberry. The wild Marsh Cinquefoil is a potentilla, but some of the garden sorts are shrubby subjects ranging from 1 to 3 feet in height, with floral coloration varying between white and scarlet or yellow and purple.

Propagated by division, or may be grown readily from seed. *Agropyria* has elegant silvery leaves.

Potting Hints.—Too much insistence cannot possibly be given to the importance of proper potting, as regards every plant so treated. The right size of the pot for the subject for the time being must be carefully chosen, and the pots should be rendered scrupulously clean and perfectly dry before the soil is placed therein. The drainage must be complete also, and systematic. Over the hole at the bottom a concave sherd or shell should be first placed, with clean crocks above, the larger below and smaller above. Next should come fibrous or lumpy mould, and then the requisite compost pressed firmly down whilst unwetted. Then the plant, its roots carefully spread, and finally the soil to surround it and reach the pot sides, all being nicely thrust down taut with the finger-ends and knuckles, leaving the stem of the subject erect and well fixed in the centre, with a good half-inch of space between the surface of the neatly-evened soil and the pot rim, more room being left in large pots to facilitate watering later on. To settle the soil round the roots, after planting, the pots should be plunged in a pail or other utensil with water reaching above the rim, given a good soak, and then stood to drain. Thus you get the fair start which is half the battle in pot plant culture. Careless and clumsy planting invites and occasions multitudinous failures. Free percolation of water round the roots, and efficient aération are quite as essential as suitable soil, and the former must be materially assisted by the use of broken charcoal above the crocks, and charcoal dust in the compost. Stagnation spells plant slaughter.

Primrose.—The common "pale rathe" Primrose of the British woodlands, always a welcome harbinger of spring-time, grows readily in leaty soil in shady nooks of the garden or hollows of the raised kitchen. The double varieties, mainly raised from a Japanese stock, are very hardy and very beautiful. There is a good range of flower colour in these, white, yellow, lilac, mauve, blue, and crimson. They are closely allied to the polyanthus, and succeed with similar culture, being propagated by division.

Primrose, Evening.—(See *Evening Primrose*.)

Primula.—What is generally understood under this head is the Chinese genus, *Primula sinensis*, so much cultivated for greenhouse and general indoor display in spring, though of course all the true primroses really belong to the family. There are many varieties, the florists having paid much attention to their hybridisation improvement. Good seed having been secured, it should be sown in a compost of half leaf-mould and a quarter each of yellow loam and sharp sand from March to June, over slight bottom heat, shading until after germination. Transplant the seedlings as soon as they are big enough to handle into boxes or pans, well drained. Later shift into single pots, giving a greater proportion of loam to the compost, and hardening by exposure to the shade. Top-dressing and manual watering (weak) may be given as the flowering time approaches, placing the plants near the glass in well ventilated frames, or on shelves in the greenhouse. Primulas can be increased by division of the crowns with a portion of stem and root attached to each place; when growth is established there may be repotting and treatment generally as for developing plants obtained from seed. The choicest primulas never need a temperature exceeding fifty degrees at night in winter to keep them in robust condition. Early sowing and forcing treatment will bring some into bloom in November, and successional flowering can be kept up into late spring. The variety *obconica* is a very persistent bloomer.

Prince's Feather.—(See *Amaranthus*.)

Propagating.—There are several methods of plant propagation, natural and otherwise. Seed-sowing will be found to have been treated in a separate paragraph. Offset from the parent bulb or stem of the plant above the soil furnish a second method of increase. Slips or cuttings are young shoots detached and trimmed with a sharp knife, for pressing down upon or into proper soil. These should be taken when the parent is in vigorous condition, if possible,

and clean cut below a joint, as this facilitates the formation of the callus, from which root growth must emanate, and cuttings must always be placed in the shade until the root growth has commenced. Division of the plant means the breaking up of the subject into separate pieces, each having its portion of stem, leafage, and root. These should be planted separately in a kindly and suitable soil, and tended carefully until capable of supporting themselves from the nutriment provided for the purpose. Propagation by suckers is the detachment of spreading roots which have thrown up a stem; these should be cut away as near to the stem from which they emanate as possible, retaining all the root development of the sucker in the operation. Runner propagation is the pegging down of low branching or superficially spreading growth to induce the formation of roots therefrom with subsequent severance of the shoot so dealt with. Layering is a modification of this, the root growth in that case being accelerated by an incision in the depressed stem. Some plants like the strawberry, "creeping Jenny," "mother of thousands," and others root their own runners, and are styled stoloniferous. Then there is grafting and budding, or the enforcement of a well-established, coarse, strong-growing subject to incorporate with itself a section taken from a tenderer and choicer relative, as the rose on the briar, fine apples on the crab, and so on. This is usually done by grafting, in which the standard is cut down and cleft perpendicularly to receive a prepared piece of the subject from which new growth is desired. The stock is condemned to spend the rest of its days in conveying nourishment to the graft, thus suffering total eclipse. There are numerous variations of practice in this latest horticultural particular, to suit different circumstances, and for their mastery, technical knowledge, which it is not possible to convey here in detail, is requisite.

Pyrethrum.—"Coloured marguerites" many people call the varieties of Pyrethrum roseum, which rank among the most acceptable of early summer flowering border perennials of the early herbaceous order. From the type they have so far diverged as to include subjects bearing the bloom of white, yellow, and red in many shades, as well as rose, and both double and single in form. Pyrethrums may be raised from seed and cuttings, but are most safely increased by root division in early spring. A second crop of flowers may be obtained by cutting down the leaf stalks to the ground when blooming is over, forking round, and watering with liquid manure to encourage new growth. Wood ashes or soot may be employed as a dressing for the double purpose of fertilisation and keeping slugs away when the shoots begin to appear on the crowns. Mulching is advisable, too, for pyrethrums where the soil is light, especially in time of drought. Tschihatsew is a close growing evergreen pyrethrum, good for growing on slopes instead of turf, and also for rockery furnishing. It bears long stalked white flowers. The strongly, and to many disagreeable, odouriferous feverfew, single and double white, also the useful golden-foliaged Pyrethrum parthenium aureum belong to this genus. For carpet bedding, lines of the latter should be pinched back to keep dwarf, and every flower bud removed.

Quaking Grass.—*Eriophora maxima*, the most popular of the curious annual trembling grasses, grows readily from seed, and is very useful for bouquet work and preservation for winter decoration.

Ranunculus.—Both Persian and turban ranunculus may be planted in November, 2 inches deep and 5 inches asunder, care being taken to place the tubers the right way up, or they may be set out surrounded by sand in February in deep dug pits of rich loam, well enriched with decayed cow manure, and whilst growth is in progress there should be plentiful watering. Offsets from the tubers, each, however tiny, having its accompanying root claw, furnish the most reliable method of propagation, for the ranunculus rarely comes true from seed. The tubers should be stored in a drawer containing dry sand when taken up at the end of July after flowering, until planting time. The flowers of the variety *acris*, in its double form, are sometimes called "Bachelor's Buttons." Gramineus

has blue-grey foliage and shining gold flowers. Gradations of white, crimson, scarlet, pink, yellow, brown, purple, and black selfs may be met with among the ranunculuses, and some of the flowers present two or more colours in combination, the markings and edgings being in cases very attractive. The type originated in the Levant, and the Persian section should be shaped like a ball with one-third sliced off the top, the petals lying close and light from outside to centre. The compact blooms of the turban are all of positive colour, and there are variations to a semi-double condition classed as French ranunculi, which are particularly floriferous and vigorous of habit.

Red-Hot-Poker Plant.—The tritoma, or kniphofia, as this singular and showy perennial is variously styled by the florists, is, in popular parlance, the "torch lily," "flame flower," or "red-hot-poker plant." It has long and graceful sword-like leaves and gorgeous spikes of orange and scarlet bloom, changing to greenish-yellow. It should be grown in deep-dug, well-manured soil, and planted with the crown about an inch and a half below the surface, and protected in winter time with a covering of litter or sawdust, firmly trodden, which may be removed in early May. The tritoma will absorb a large quantity of liquid manure in the growing period.

Reseda. (See *Mignonette*.)

Rhodantha.—Beautiful, half-hardy everlastings, of neat and compact growth, very decorative in garden borders and the conservatory or parlour window. Requires light and rich soil and sheltered situation, and must be raised in gentle heat from seed, and hardened before planting out on a warm border in summer. The flowers in the variety *Mangisii* are light rose with silvery calyx, and should be gathered young for drying.

Rhododendron.—These magnificent summer blossoming shrubs grow only to perfection in moist, peaty loam, quite free from lime, and must not have the bark broken or the stem loosened in re-planting. There is very considerable diversity as to size and flower coloration. Rhododendrons like plenty of room, and the shelter of tall trees from north and east winds. They flourish in towns if not crowded too much. The Dahurian variety flowers in early spring, when its pretty purple bloom is particularly welcome. Arboreum is a hardy and reliable hybrid, and the Catawbiense varieties are handsome both as regards flowers and foliage.

Ribes.—The "flowering currant," *Ribes sanguinea*, is familiar to most folk as a very pretty spring blooming shrub, whose abundant plinky and crimson racemes open with the opening leaves. *Ribes grossularia* is the gooseberry. There are other varieties bearing white and yellow florets, the latter being sometimes known as the "Buffalo Currant." Any soil and any position seem to agree with these bright and accommodating bushes, which are amenable to clipping for hedge-formation, and do not object to a seaside situation. They should be planted when the ground is not too wet and pasty, towards the end of October.

Rockeries.—The rockery, or rock garden, be it large or small, is largely a matter of individual taste, and the utilisation of opportunity in the choice and disposition of constructive materials. Brick burn, quartz, large clinkers, rough lumps of alabaster, broken marble, sandstone, limestone, or anything else at once available and suitable may be employed, and arranged in irregular and picturesque stepped banks, with many nooks and crannies to form receptacles for soil, in which to grow the right sort of plants, shrubby, herbaceous, and trailing. Stability in building up the rockery, coincident with avoidance of formality, and the provision of a plenitude of firmly-placed and nutritive mould between and behind the facing boulders, are the chief essentials, with perfect drainage under all. Every stone or whatever else be utilised should have its part in making a permanently fixed ledge, securing in position a sufficient depth and expanse of sunken soil to afford sustenance to one or more subjects, and to permit others to be planted nearby, and otherwise attended to without structural disturbance. The right sort of plants, and there is a wide range of choice, should be carefully selected and

introduced to the situation best adapted to their natural needs. Some require shade, some much moisture, some revel in strong sunlight. Perennials are preferable, as, once introduced, and properly established, they call for little after-treatment beyond keeping within bounds and occasional superficial dressing. Auriculas and alpinas generally, gentians, the saxifrages, the sedums, stonecrops, or (Creeping Jenny), aubretias, anemones, dwarfed trailing campanulas, arabis, rockcress, the houseleeks (*Sempervivum*), soldanelles, the catchflies or silenes, the smaller scillias or milkfalls, the bugle flower or ajuga, the "gold dust" or *orizysm*, the antenar, ("snow-plant"), the thrifts (*Armeria*), the alpine wallflower, cistus (the rock rose), the Virginian claytonia (which likes a moist habitat), the hardy cyclamens (requiring slight winter protection in most cases), the American cowslip (*dodecatheon*), *Dianthus neglectus* (the glacier pink), the rosette-like draba, the creeping mountain aven or dryas, *Saxifraga purpurea* (the hardy pitcher plant), the mountain thymes, the soap wort (*Saponaria*), the linacs or periwinkle, some of the smaller veronicas, the sanguinaria or bloodroot, the Alpine primulas, the dwarf Alpine phloxes (particularly the profusely silvery-grey flowering variety *stellaria*), *Platycodon Mariessii* the Chinese balloon flower), *Papaver alpinum* (the Alpine poppy), *Orobanchis vermis* (the spring-blooming bitter vetch), *Omphalodes verna* (a creeper with flowers like the forget-me-not), the dwarf wood sorrel, the creeping cup ower (*Nierembergia*), *Lithospermum prostratum*, *Erica carnea* (the winter flowering heath), the rock strawberry (*Fragaria*), the rock geranium or Crane's hill, the Hawkweed, dwarf-irises, *Lamium maculatum* (variegated foliage), all form admirable rockery subjects from which to make a selection, and many of the hardier ferns, such as *Scolopendrium*, spleenworts, and polypodiums, can be interspersed with effect in shady crevices.

Rocket.—Free flowering and hardy herbaceous plants, annual, biennial, or perennial in duration, and very sweetly scented. Will flourish in any good soil, and are easily propagated, the annuals from seed, and others by division. There are double and single sorts, mostly with white or purple bloom.

Room Plants. (See *Indoor Decorative Plants*.)

Roses.—Hybrid perpetual roses, growing on their own roots in bed or border, form the most considerable section of the "Queen of Flowers" cultivated in our gardens. The treatment necessary to make the best of them applies, with slight variation, to all the other classes of outdoor roses. The soil should be deeply dug and richly manured, and the planting may take place at any time during propitious weather after leaf-shedding and before the buds begin to swell in April. Any damaged root terminals should be trimmed off with a sharp knife, the root masses being then spread out wide, and covered with fine soil in a sufficiently large hole and pressed firmly. Fill up the surface and tread well all round, then give a good soaking to settle the mould in place. Standards budded on a stock should be given a stake for support. Pruning must be practised with discrimination, standards having all weak growth eliminated and the strong outward-pointing shoots cut back to four or five eyes in April, in each case the centre being left open, while own root roses should have the thick vigorous new stems removed entirely or shortened to a single bud, leaving no one shoot to cross another. It is better to prune a little late than too early, so that the new growth may not be nipped by severe spring frosts. In climbing roses the long ripe shoots may be pruned very much less drastically, and trained to wall or trellis with but a short length at the end removed, just before the buds begin to break. For all outdoor roses, plentiful root mulching with rich but well rotted manure to be washed down by rain or artificial watering is good. The staple of the soil should be strong loam. The Provence, Cabbage, Austrian and other summer blooming roses, including the favourite moss section and striped varieties such as the old York and Lancaster, flourish best in an open situation and not too stiff but

deep and rich soil. The hybrid perpetuals should never be too closely placed together, nor have their growing ploughed up by other garden stuff. These are whites, yellows, all shades of blush and pink to scarlet and deep dark crimson to choose from, and every good nurseryman catalogues the best varieties in each gradation of colour. China and monthly roses, either in beds or on walls, require a little protection in winter, which may be given by a covering of ashes at the roots. The alpinas, open petalled and generally semi-double are almost thornless. The Bourbons mass and bloom grandly in autumn, and some sorts, such as *Souvenir de Malmaison*, are so desirable that they should be in evidence wherever room can be found for them. Gloire de Dijon and others of the exquisite tea-scented section ought also to be in every collection, and amongst those most employed for wall decoration mention may be made of the coppery Noisette, William Allen Richardson, the white Aimée Vibert, the pale rose Madame Auguste Ferrin, Devonian, General Jacquinet, and the *Marchal Niel*, which should have a sheltered southern aspect. Any of the choicer roses do well as pot subjects in a cool greenhouse, and some of the climbers are useful for pillar decorations under cover. The white, red, and yellow Banksian and Ayrshire roses are splendid and floriferous ramblers. The dwarf polya. these roses are pretty pot subjects for window furnishing, many of them, and the climbing kinds, such as the Crimson Rambler, make a rich display. The ustrian Brans, single and semi-double, are particularly attractive when nicely grown, and the same remark applies to the evergreen climbers, Princess Marie (pink), *Félicité de Perpetue* (white), and the Garland, whose clustering nanken-pink flowers fade to white and exhale a musky odour. Even the commoner kinds of sweet briar are bright, showy, and always pleasing, and Lord Penance's hybrid couple admiration wherever introduced, the fruit being most decorative after the flowering is done. They need but little pruning. Roses are propagated by cuttings from suckers and by budding. Cuttings should be taken from shoots made in late autumn, with a small portion of the preceding year's wood attached, and struck in sandy soil in the open. Suckers are easily removed and transplanted. Budding, to succeed, is an art best acquired from demonstration by a gardener. Green fly should be removed by syringing or the application of insecticide immediately upon its appearance, whether on indoor roses or those of the open, and the "Rose Maggot" or larva of the leaf-rolling moth, must be looked out for and destroyed before it can effect mischief. Mildew sometimes gives trouble, when sulphur dusting should be resorted to whilst the foliage is moist.

Salpiglossis.—This is a curious half-hardy annual carrying petunia-like flowers, richly pencilled. It blooms in August, and reaches a height of 2½ to 3 feet. Sow in heat in March, potting off the seedlings singly and protecting them until the bedding out period—early in June—or they may be transferred to larger pots for conservatory or indoor decoration. The flowers are splendid for cutting. The plants like a sunny situation and very rich soil. Some of the varieties of *salpiglossis* have creamy-white flowers, veined with gold; others are velvety crimson, gold pencilled, and there is considerable variety.

Salvia.—Half hardy perennials for greenhouse flowering or ornamental summer bedding. They make pretty plants and carry very bright blue or scarlet blossom. They want winter protection, and cuttings or seed must be started in heat.

(See *Soil*.)

Saponaria.—*Saponaria calabrica* is an invaluable edging annual, dwarf and compact in growth, but a splendid spreader, studded with tiny stars of pink bloom, which continue through summer and autumn. There is a white variety, and both may be sown in drills in April in the border. If placed between Cerastium (Snow in Harvest) and the blue Nemophila, it gives a grand ribbon effect. *Saponaria corymbosa*, the Rock Soapwort, is a trailer and a perennial, capital for rockery work.

Saxifrage.—Hardy plants, mainly perennial, very suitable for town gardens and rockery decoration.

"London Pride" (*Saxifraga umbrosa*) is good for edging, especially in moist positions, and always looks pretty, especially when its light branching blossom is thrust up. The thick-leaved *Saxifraga*, or "Sow's Ear," is coarser but very utilitarian as a clother of barren soil, and the mossy varieties, *Camposii*, and the tufted *Cespitosa* are most decorative. The curiously encrusted *saxifragas* require a sunny and dry situation, and longifolia and Macrantha are much in vogue as pot plants because of their handsome bloom spikes. All these can be readily propagated by cuttings carrying root growth, and the distinctive *Saxifraga armentosa*, which is so great a favourite for hanging-baskets, and is commonly called the "Creeping Sailor" or "mother of thousands," increases by rooting runners, like the strawberry.

Scabious.—This is a sweet old garden subject, always welcome either in the annual or perennial form, and is often called the "pincushion flower." Its familiar stamen-studded discs of bloom, lavender, rose blue, purple, and sulphury white, are very useful for cutting. Some species grow wild in the cornfields, and *atropurea*, sometimes styled "the Mournful Widow," is a deep-hued and handsome cultivated favourite. Another popular scabious is *arvensis*, "the Gipsies' Rose" (blue), white and crimson, King, and the pure white *Snowball*, comparatively recent evolutions of the florist, find many admirers. The annuals grow freely from seed, and the perennials are propagated by division.

Schizanthus.—Half-hardy annual, which may be adapted to pot culture or for border growth in good rich soil. The peculiar shape of its pretty, varicoloured bloom has procured for it the popular names of "Fringe Flower" and "Butterfly Flower." Sown in autumn, it will come out in the greenhouse in the following spring early.

Schizopetalon.—Useful flowering annual, almond scented, twelve inches.

Schizostylis coccinea.—A late autumn flowering perennial, throwing up spikes of brilliant scarlet bloom, which may be protected by shelter for winter cutting.

Scilla.—The wild hyacinth, or "Azured harebell," cultivated varieties of the bluebell, are employed with effect in the garden for spring blooming. *Bilola* has white and rose as well as blue flowering forms, and *Sibirica* comes amongst the very earliest of outdoor flowering bulbs. Planted in autumn, and top-dressed in succeeding seasons, they will stand and bloom well for years. *Scilla maritima*, a Mediterranean member of this genus, supplies the Squill so much employed in medicine.

Scutellaria orientalis.—The "Skull-cap," a hardy, flat-growing little subject, with lilac and yellow flowers, good for border edging and rocky cultivation.

Sea Lavender.—The great Sea Lavender (*Statice latifolia*), with its graceful light blue "Everlasting" blossoms borne in spreading panicles, makes a splendid border subject if cultivated in a sunny position. May be propagated by division in spring. There are pink and white varieties.

Sedum.—The Stonecrop, and its congeners, an extensive family (chiefly perennial), of thick-leaved and spreading growth, many of them bearing flowers profusely, white, pink, or yellow, handsome, having brown, purple, or mealy-white foliage. Amongst the best of rocky subjects. The variegated *Virens monstrosum* is the curious cockscomb-headed sedum, whilst the variegated *Sibboldi* makes a good hanging basket plant. They will all grow well in shallow soil on rockeries or in pots in the strongest sunshine, and increase by division.

Seed and Seed Sowing.—Seed of all sorts should be good; that is, it should retain the fullest vitality, and therefore care should be taken to obtain it from a reliable source. Generally speaking, it is better to sow seed of the preceding season's growth, properly harvested and preserved, and this is the condition in which it usually comes to hand in packets from reputable vendors. If kept over to a second season seed ought to be stored as much out of the reach of damp and atmospheric action as possible. In

sowing, a good maxim is not to bury the seed further below the surface than twice its own thickness, though large and bulky seed may go down deeper by comparison. Fine seed like that of the annuals should be thinly distributed over an even, firm surface, and dusted with minute particles of covering soil; that a little larger in shallow drills, the ridges of which are afterwards to be gently replaced so as to make all level. The mould ought never to be pasty or sticky to receive seed, but crumbly or friable; therefore for outdoor sowing a dry still day is preferable, especially if this be succeeded by gentle rain. As to season and position chosen, both must be according to the variant requirements, so that the tender seedlings suffer no avoidable hurt from inclemency. Indoor sowing should be done in particularly well-drained pots or boxes of light and finely sifted soil which admits of the free passage of air or moisture.

Seedlings. Treatment of.—The tender seed leaves of every subject call for protection from insect attacks, from the voracity of slugs, and also from an excess of aerial heat. The great thing in managing seedlings is never to permit them to receive a check. It is often essential to secure germination by placing the seedpan over gentle bottom heat, and this having been accomplished, a slightly cooler and better ventilated position should be sought for the seedlings, chill being guarded against. Directly transplantation becomes necessary it should be proceeded with, the young plants being most carefully lifted, with as little root disturbance as possible, and pricked out into new quarters, whether in pots or boxes of properly prepared mould or nursery beds, allowing sufficient room for the next stage of development. Then shift on and on, coaxing the younglings into the perfect plant by the provision of increased nutriment and additional exposure to the atmospheric conditions most suited to its special case, doing everything intelligently and according to ascertained good practice.

Shrubs and the Shrubbery.—Besides *Rhododendrons* and *laurels* of various descriptions, there is a great diversity of suitable subjects for the furnishing of ornamental shrubberies in town and country, both amongst deciduous and evergreen species, while many bearing beautiful blossom are obtainable at any well-stocked nursery. There is the *Pieris* or *Andromeda*, of which the variety *floribunda* shows a wealth of white flowers not unlike *Lilies of the Valley* in March. Soil that would suit the *Rhododendron* does nicely for it, but good sandy loam without any peaty admixture will serve, if a sunny and open position be allotted. The *Laurustinus* or *Viburnum* comes in, so do the *Eunymus*, *Box*, *Berberis*, *Acacia*, the golden-leaved *Thuya* or *Arbor vitæ*, the tender green *Cryptomeria japonica*, the variegated *Cypresses* or *Retinospora*, the *Lilacs*, the cream-white *filaged Taxus*, the *Gaulther Rose*, the *Strawberry tree* (*Arbutus Unedo*), the *Tree of Heaven* (*Ailanthus glandulosa*), and the bold *Paulownia Imperialis*, which latter requires pruning hard back, annually, almost to the ground, to secure the best of its flowering. Other useful shrubs are the flowering *Currants*, the *Jew's Mallow* (*Kerria japonica*), many decorative *hollies* and dwarf *Conifers*, the orange-berried *Cotonaster*, the double *Gorse*, the *privets*, the *Snowberry* (*Symphoricarpos racemosus*), the larger *Veronicas*, the feathery-leaved *Tamarisks*, the sweet *Bay*, the white-flowered *Escallonia*, the glossy-leaved and yellow-cattened *Garrya*, the metallic looking and prickly *filaged Mahonia*, the bright and smoke-resisting *Olearias*, the *Mock Orange* (*Philadelphus coronarius*), the *Californian yellow wood* (*Virgilia lutea*), the shrubby *honeysuckles* (of which *Lonicera fragrantissima* is one of the best), the hardy *Azaleas* and *Heaths*, and many more that might be mentioned. They require varied treatment as to soil and situation, respecting which consideration of their natural habitat furnishes the best guide, but in most cases good garden mould over a well dug and judiciously manured subsoil will serve their planting and upkeep in vigour. There should be no attempt at crowding. Better a few well-chosen and shapely and good growing plants than a cramped lot of starved stragglers. One must have space for a shrubbery, but a selection from what is here specified will be useful to

many who have at their disposal banks and front gardens not occupied by small perennials or bedding plants. A great argument in favour of shrubs in ornamental horticulture is the little trouble most of them entail after discriminating plantation.

Silene Pendula.—Rosal pink border annual, one foot, good for growing on a rockery. There are double and single forms.

Slugs. (See Pests of the Garden.)

Snape-dragon. (See Antirrhinum.)

Snowdrop.—These sweet little spring blooming bulbs are best planted in October, though they may be put out later at the expense of retarded flowering. They delight in shady and peaty loam, and should be two inches underground, one inch apart, and subjected to no after disturbance, which explains why they flourish in a grass plot. There are autumn flowering as well as spring snowdrops, which should be planted as early in the year as procurable. Elwes (the Giant Snowdrop) is a spring bloomer and does well in a pot, for indoor decoration, if given plenty of air.

Soil.—Suitable soil, matured as to its components, each containing the full quota of nutritive qualities, is very necessary to growing success, both out of doors and as regards pot culture. Spent or soured soil, or soil otherwise out of condition, is worse than useless in horticulture. Therefore let there be, imprimis, prudent provision of essential ingredients, and afterwards their proper and thorough admixture. The preparation of soils and composts to supply the variant needs of plants is the elementary consideration which the amateur requires to get a mastery of. In practice he should have at hand as much as he will want of good fibrous loam, secured, if possible, by the stacking, root side uppermost, for six months, or until all vegetable life be dead, of closely shaven mellow pasture turves. Portions of the stack can be broken up and passed through a coarse or fine sieve as and when requisite, eliminating simultaneously any discoverable insectivorous germs, which may have obtained lodgment and retained vitality, a precaution which should have attention when all other compost ingredients are riddled and overhauled. Thoroughly rotted vegetable matter of almost any character will furnish the indispensable leaf soil, though of course, leaf sweepings, pure and simple, are best. When decomposition has become complete in the heap, any convenient quantity may be removed to the potting shed to dry and facilitate handling. But, procured from a common, and matured by heaping in an airy place where moss growth receives no encouragement, or purchased prepared for use, is another requisite. River sand, washed free of all other than silicate, must be provided. It may be sharp and coarse, or fine and smooth—as the silver or Calais sand so useful in the germination of seed or cutting-striking. Clean road drift furnishes valuable material for the gardener's service. Manure should be prepared by throwing short stable litter into a light pile and turning occasionally in the sun to sweeten it. That containing the excreta of cows should be kept separate from collections of horse-droppings. The former may be made ready for immediate use by charring, while horse manure is in the best condition for incorporation with garden soil after having done duty in a hotbed. Wood ashes, or the residuum of a bonfire of garden rubbish, possess fertilising properties of some potentiality and importance for the enrichment of mould, and decayed organic animal substances all have greater or less manurial value according to the amount and character of the phosphates and alkaline salts they contain. Burnt clay and marl can also be advantageously employed in horticulture, while man dressing lightens and mellow heavy land materially. To keep garden soil at its best there must be systematic digging, forking, and turning over, in order to promote aeration, drainage, and pulverisation, and composts used for pot plant culture should be cast away or worked in after impoverishment with stiff outdoor soil, to the lightening and consequent improvement of the bed or border earth.

Solanum. (See Egg Plant.)

Solomon's Seal. (See Polygonatum.)

Sphagnum.—A moisture-absorbing moss obtained from bogs and swamps, and employed in horticulture as soil for tree-growing orchids. Useful also for lying, after saturation, over seedpans to keep the germinating seed damp and dark.

Spiraea.—A genus of shrubby and mainly perennial marsh plants of which the wild "Meadow Sweet" is an example. Carries feathery spikes of very decorative flowers. *Spiraea japonica*, the familiar white conservatory sort, is grown in great quantity by the market gardeners for indoor decoration, in winter and early spring. The *Spiraea* thrive in well-drained, sandy loam, mingled with leaf soil, and are propagated by root division. In the growing and flowering period, *Spiraea* must have copious and frequent watering to keep them going. There are golden-leaved, pink, and white-flowered varieties, double and single. The varieties *Lindleyana* (white) and *Douglasii* (rose) will grow up to six feet high on a shady shrubby border, but the dwarf sorts are most in favour because of their pretty habit and adaptability to the conservatory.

Spring Flowering Plants.—Spring blooming plants are a great desideratum in a garden, and every effort ought to be made to have a good show in the borders as early as possible. Therefore, a liberal supply of anemones, subrotas, arabis, hardy winter flowering cyclamens, snowdrops, violets, crocuses, cowslips, Lent lilies, primroses, scillas, or snow globes. The exquisite little winter and spring frises, the star of Bethlehem, spring snowflakes (*Leucocorydium vernum*), and other hardy ground flowers should be secured. A piece of *Jasminum nudiflorum*, with its bright yellow flowers borne on the naked branch, should be secured for garden wall or trellis, too. All these and many more may be provided by planting at the proper time, and by no means should the odoriferous wall-flower, in its wide range of attainable variety, be overlooked. It seems to smell sweeter in the spring than at any other period, perhaps because it has the garden much more to itself then than later. A well-stocked and well-tended garden is very charming, but most of all when with bright hues *Flora* strives to shame *Winter* from "lingering in the lap of Spring."

Southernwood.—*Artemisia abrotanum*, an aromatic shrub with hair-like, segmental leaves, familiarly styled "Old Man," "Lad's love," or "Lad love lass." Very useful and pleasant for fringing flower bouquets, and easily rooted from cuttings. It may be grown to a good-sized bush and kept tidy by shortening the roots. **Starwort.** (See *Michaelmas Daisy*.)

Statice. (See *Sea Lavender*.)

Stocks.—These sweetly scented flowers are mostly half-hardy biennials, though there is an extensive section which need re-sowing annually from seed, and all thrive in a not over rich soil that contains old mortar. *Mathiola annua*, "the Ten Week Stock" is the most widely cultivated, and gets its distinguishing name from the fact of its generally coming into bloom at the age indicated. There are many colours of this, all beautiful, double or single, and they should be sown in March under shelter, pricked off to harden before bedding out. The Imperial or perpetual stock is an autumn bloomer, and will continue to flower up to Christmas almost during a mild season, if sown in early spring, or it may be sown in July to come on for the following June blooming. This variety is a robust German hybrid of the Brompton stock, a branching section of the genus which does not flower the first season, and is in consequence called the Winter Stock by some. It should be sown thinly in light sandy soil in an exposed situation during May, and transplanted after thinning in autumn, with great care. The Giant Cape stock, with glorious spikes of fragrant pyramidal bloom is a variation of the Brompton and needs similar treatment, with unstinted watering in dry weather.

The Stove.—This is a structure which scarcely comes within our present scope, adapted for heating to the temperature suitable for the cultivation of tropical plants. A small hothouse of the "stove" description, is, however, a very valuable thing in any garden, as it serves admirably for the propagation of many tender and beautiful subjects, which will grow in the greenhouse or bedeck conservatory when they have attained perfection, as well as permitting one to bring on gorge-

ous variegated subjects like the Croton, the Maranta, and the Alocasia or choice blooming plants such as the Alamanda, the Dipladenia, the Clematid, and the waxy Hoyas, Anthuriums, Pitcher plants, and many of the finest equatorial orchids. There also may be grown in the shade some beautiful fern forms, to whose healthy existence a heavy moist atmosphere is essential, as for instance—to take differing types—the gold and silver Gymnogrammes, the Hymenophyllums, and all the more lovely tribes (especially when young) of tropical and sub-tropical tree ferns. In case the smallest stove to ensure any measure of success there should be a tank fixed over the flue or hot water pipes, which furnish the requisite heat to the house, this tank from the warmed water it contains giving off something like the humidity that plants from a dense African or mid-American forest luxuriate in. By placing a pierced cover over this you will provide simultaneously permanent bottom heat which may be utilised for all sorts of propagatory and forcing purposes. Such a house can be constructed inexpensively, for it may advantageously be half sunk in the ground so long as provision be made to keep the stokehole outside free from flooding in wet weather. It must have efficient ventilating arrangements, particularly overhead, and should be span-roofed to catch all the sunshine, with means of ready-shading from the direct glare of summer, whilst the heating system must be efficient and easily controllable. Unless all this can be secured the amateur horticulturist is better without a stove altogether, and left to rely on holed and greenhouse. Herein is summarised the science of the stove, and the principles sketched apply to such a hothouse, whatever its size.

Sunflower.—The Sunflowers include Helianthus and Harpaliums, the former genus containing the tall and imposing subjects, with their great yellow discs of bloom, which are so conspicuous in many gardens in the autumn, the latter comprising numerous varieties of dwarf flowering plants, almost black at the centre, yellow edged and stamened. All are easy of culture, but the gross-growing giants need plenty of room and a rich soil to come to their best. They should be sown in April in front of the shrubbery or where they are to stand anywhere. The Harpaliums are perennial and should be so treated. There is a double Harpalium which comes in nicely for cutting.

Sun Plant. (See *Portulaca*.)

Sweet Briar. (See *Rosa*.)

Sweet Pea.—Sweet peas, of which there is now endless variety, all of very great attractiveness, should be sown in good soil, in March or April in a sheltered position out of doors, or in pots in a cold frame in February to be hardened for an early start in the borders. These should be planted out with great care, not breaking the ball or injuring the running roots, and pressed in firmly. There are dwarfs that make beautiful shrubby bedders, besides medium and tall growing climbers of every hue, soft and variegated. The latter should be staked soon after planting or trained up trellises, as the blue lengths, and given a sunny position, with plenty of watering. They may be pegged down as trailers also with effect. Flower cutting should be constant, as this prolongs the blooming period materially, by preventing seeding, and plenty of room should be allowed for the development of the full beauty of this engaging garden subject. The Eckford variety and some others of the more recently introduced sweet peas of the florists, foreign as well as British, are exquisite as to delicacy and shading and flower size and richness of aroma, and the culture of a selection of the most distinctive descriptions should be entered upon by every possessor of a garden. They entail but little trouble if the soil be well prepared and worked before the sowing, and the support supplied be suitable, and no summer flower gives greater satisfaction and is brighter and more acceptable than the universal popular Sweet Pea. The perennial Section is referred to under the botanical name of the genus, *Lathyrus*.

Sweet William.—A free flowering border perennial of much beauty and diversity of coloration, embracing many varieties of *Dianthus barbatus*. They should be sown in well-tilled beds of enriched soil in

June, and the seedlings pricked off as soon as large enough. Sweet Williams deteriorate greatly after the second season, and should be renewed from seed, or increased by off-sets. The auricle-eyed varieties bear immense heads of bloom, in which the individual flowers, white in the centre and edged with rich hues of crimson and other shades of red, are large and handsome. A good lookout should be kept for the "Leather Jacket" grub, which is very fond of eating through the stems of Sweet Williams just under the surface, and if not caught and killed will soon work devastation among and ultimately destroy the most promising plants.

Syringa. (See *Lilac*.)

Thrift.—*Armeria lauchiana*, the pink Thrift, is a splendid dwarf edging or rockery plant, delighting in a sunny position, and flourishing in good loamy soil. The variety *Vulgaris alba*, with white flowers, is neat and dense-growing, while *Cephalotes*, the Giant Thrift, is very useful for cutting. Increase by division, planting firmly singly or in rows.

Thuja.—The Arbor vitae, a very decorative shrubby subject, good also for growing in little beds or lawns, will flourish in fibrous loam, and the variety *Aurea variegata* is especially effective. Should be transplanted in April.

Tobacco Plant.—*Nicotiana affinis*, of delicious odour in the evening, is a fine subject either for the greenhouse or outdoor culture, and should be raised from seed sown in February or March in gentle heat, the seedlings being transplanted into rich sandy soil and gradually hardened if intended for bedding. It spreads and branches freely, if kept well watered, making immense fleshy leaves upon stimulation, and carrying pretty white tubular blossom of greenish tinge on the exterior. When the plants die down in the autumn they may be covered with ashes, when many of them will spring into growth again the following season, as the *Nicotiana* is, properly speaking, a half-hardy perennial. The variety *Macrophylla gigantea* is particularly large as to foliage, and sends up long flower spikes of a purple white shade, while there are some pink sorts; but the white type is the most generally useful and sweetly perfumed. It seeds readily in the border, and young plants coming up in summer bear mowing.

Tools.—There is an infinity of garden tools and implements in the market, all of them more or less useful, but most of them desirable and indispensable. What are indispensable are the digging-fork, the spade, the rake, the trowel, the watering-pot (with spout and rose), the sieve, the Dutch hoe, a pair of clipping shears, and a handy hammer, whilst, where there is grass, a scythe or lawn mower cannot readily be done without. The man with a greenhouse or even a hotbed will need a thermometer and a syringe, while a good garden hose will save an infinity of trouble wherever a good force of water is obtainable from the tap. A drill-hoe is very handy in sowing time, but the rake may be manipulated so as to perform its work where one is not available. "A good workman," says the adage, "is independent of his tools," and this applies in the garden. The man who really loves horticulture may obtain the best results by the employment of a very few simple implements, where the potter will fail though he should purchase the entire complicated stock of a vendor of so-called "garden requisites."

Trachelium corniculatum.—A good border or rockwork biennial, bearing pretty blue flowers.

Tradescantia.—A genus of perennial trailers, containing varieties suitable for ornamental baskets in the window or conservatory, or for greenhouse culture, with leaves sometimes prettily striped, produced on long and gracefully pendant growth, also some of a sufficiently hardy nature for summer bedding. The common Spider-wort is the most familiar of this form of *Tradescantia*. The greenhouse sorts require rich moist soil, and root readily from cuttings over gentle heat, or may be propagated by root. *Tradescantia Zebrina* is a good green or variegated subject for hanging over the sides of vases or pots in the winter garden.

Trees (Ornamental).—The *Laburnum* is a very

effective ornamental tree for even small town gardens, its racemes of yellow blossom being particularly effective in spring, and the Acacias come within the same category. Some of the purple birches, the variegated maples, the weeping ashes and willows, the All Saints' Cherry, the Siberian pea tree (*Caragana arborescens pendula*), many of the Conifers, the Japanese Sophora, the white beam (*Pyrus aria*), the double and single scarlet and pink hawthorns, and the flowering almonds (*Amygdalus*), are good subjects for breaking up the monotony of low growth in a garden, and all of them may readily be established by autumnal planting in deeply dry soil. Vigorous saplings of all the arboreal species mentioned are procurable at most nurseries at prices from a shilling or less upwards, according to size.

Tritoma. (See **Red Hot Poker Plant**.)

Tropaeolum.—These elegant climbers, with which may be included for the purpose of convenience all the hardy annuals, Nasturtiums whether tall or dwarf growing, are easy of cultivation and profuse flowering. Their brilliance of colouring is untruncated, and given proper soil, which should be rich and sandy, they occasion little trouble. In the greenhouse they may be trained up canes or to the rafters, or allowed to hang over the sides of suspended pots. Nothing need be said as to how to grow the common Nasturtium. It grows itself wherever it has once been introduced, but the choice species, both single and double, should be sown in heat and carefully hardened when intended for pot bloom out of doors, and they require frequent watering. *Tropaeolum canariensis*, the Canary Creeper, is a pretty and very distinct climber, which may be sown and grown in window boxes or on the border as well as in the greenhouse. The tuberous-rooted *Tropaeolum azureum*, bearing blue flowers, will not stand outdoor treatment, but succeeds well in a warm greenhouse, as does *Tropaeolum tricolorum*, with red and black-tipped.

Tuberose.—This is a white-flowered and odoriferous bulbous-rooted plant of Indian origin, which should be started in sandy loam in a frame over gentle heat in January, giving each bulb a very small pot to itself, and giving no water till growth commences, and then but a very little, plunging the pots to the rim. Repot into larger sized (say 3 to 4 inch) pots when the roots show through the drainage hole, then plunge again until the flower spikes show, when the plants may be placed in the greenhouse or conservatory to bloom, where they last long and exhale a delightful perfume.

Tulip.—Good old mellow loam, perfectly free from any insect life in any form, should be employed for tulip culture inside and out, all stones being carefully sifted out. The best time for planting the bulbs outdoors is from mid-October to mid-November, and the beds should be well drained. Press the bulbs in on a good layer of the prepared loam, six inches apart, then cover to a depth of about three inches of soil. In taking up the bulbs after blooming for storing until the following season, allow the leaves to turn yellow first, and dry the bulbs in paper bags in the air and sun before putting away. There are singles, doubles, and semi-doubles, some of the former, including the early-blooming *Duc van Thol* description, being particularly handsome. These are well suited for pot culture, and they may be grouped effectively in large pots. They require plentiful watering when blooming, and must be shaded from the sun if the rich coloration is to be prevented from deterioration. The parrot tulips, large and showy, are grand for out-of-door culture. The summer (or May-flowering) tulips comprise most of the handsome selfs, and will stand from year to year in a suitable border. They are tall and sturdy of growth, and require rather more room individually than suffices for the earlier sorts.

Valloia.—The Scarborough Lily, a handsome bulbous subject for greenhouse culture, requiring rich, sandy loam with a peat and old mortar admixture, and large deep pots to develop in properly. Plant six inches deep at midwinter, and do not water after first settling the soil, which should be well drained, until growth commences, when weak liquid manure may be occasionally administered.

Verbena.—One of the best of bedding plants, possessing much variety, readily raised from seed or from cuttings, while pegging down the growth will root it, facilitating increase by division. The treatment accorded to the petunias will succeed for verbenas culture, and the best soil for them is a loam, leaf-soil and sand amalgam. Young plants in the cold frame should be hardened off for transfer to the flower beds in late May, and pegging down after growth be well begun out of doors will induce new shoots and protracted blooming. What is commonly called the "Scented Verbena" is a plant botanically known as *Lippia citrifolia*. It makes a very good greenhouse pot plant, the leaves emitting pleasing perfume on handling. The common verbenas, or "Holy Herb," and the wild hyssop both belong to the true verbenas family.

Veronica.—The evergreen speedwells are grand autumn bloomers for garden or greenhouse, and will flower all through the early months of winter if late planted, while the annual Veronicas (of which the little Commander Speedwell, or "God's eye," is an indigenous British variety) are invaluable for spring blooming. For early show these should be sown in autumn, and the taller growing perennial sorts, with handsome white, mauve, or purple flower spikes, propagate either by root division or cuttings, and should be planted out in spring.

Viburnum. (See **Gaulther Rose and Laurustinus**.)

Vinca. (See **Periwinkle**.)

Viola.—This genus includes all the pansies dealt with elsewhere, but the same is generally taken to signify the "tufted" bedding species so floriferous and so suited for ribboning in summer borders. Their proper cultivation is similar to that which the showier pansies succeed under, and there is a great variety of flower colour from white to plum coloured, with many shades of mauve, lavender and blue between, as well as numerous gradations of yellow. A good top-dressing of short manure or rich leaf soil after planting out and frequent watering at the roots, will be found very helpful. They seed prolifically, and can be increased readily from cuttings. The pretty little *viola cornuta* is a good outdoor edging subject still, despite the attractions of its more recent rivals, *Neapolitan*, *Russian*, and other imposing varieties of odorous violas or violets, as people call them, for distinction sake, are readily grown and forced in greenhouses, if it be borne in mind that they are shade lovers.

Wallflower.—The hardy *Cheiranthus* holds its own, and always will, amongst spring blooming favourites of the garden. It is well worthy of such constant sufrage, for its culture calls for little care, and its odour and rich coloration are ever pleasing. From the light straw of the old type to blood red, with much striping, splashing, and intermingling of the browns, we have wallflowers galore, both single and double, the latter being increased by cuttings, and all the rest from seed, which will grow anywhere. Seedlings should be transplanted early. The wallflower likes a light soil containing old mortar.

Watering.—The watering of plants in pots in the house or greenhouse should be regulated by the real need of each individual subject for the time being, moisture being gently and thoroughly renewed when a dry condition has been arrived at. This can be ascertained by examination, and tapping of the pot is a good guide. A dull heavy sound as the resultant of this will indicate that there is no drought within, and it is a very great mistake to overwater, which is apter to injure a plant than drought, which can readily be corrected. Effect as little disturbance on administering water as possible, and this can be obviated by standing a thirsty subject in a pail or tub until the water reaches a shade above the rim, letting it absorb as much as it can, and then replacing it on its shelf after draining. As a rule plants want comparatively little watering save in the growing or blooming period; they must have their rest time like other living things. Let this always be remembered. Outdoor watering must be governed by the state of the weather and the condition of the plants.

Weeds.—Weeds should be eradicated immediately

on their appearance, remembering the proverb "ill weeds grow apace." Not only are they always unsightly in the garden, but they rob the plants under culture of necessary sustenance most seriously if permitted to remain. Hand pulling after showers is an effective method of weed-destruction, for then the roots are readily and completely withdrawn, and the hoe should be kept actively employed on the surface of borders in the sunshine, as this kills the unwanted vegetation at the most vulnerable stage, besides doing the legitimate occupants of the soil a great deal of good by promoting the filtration of air and moisture to the roots. Vitriolic or other corrosive acid applications properly diluted may be employed for stopping the persistent growth of unsightly mossy weeds or grass on gravel walks which it is undesirable superficially to disturb, or even strong saline watering will often suffice, especially if done under a hot sun. Moss growths on the surface of soil in flower pots should be removed by stirring and dressing. It is usually an indication of inefficient drainage, in which case remove the cause.

Wattia grandiflora.—The grandest intense blue of any outdoor annual (called also *Phacelia campanularia*). It is a delicious dwarf six inches to a foot high, with satiny flowers like little gloxinias. Seed may be sown outdoors in March and April for summer show.

Window Garden.—Some sorts of plants may be grown inside or outside any window, if a proper selection be made either in pots or warden cases indoors, or in pots or boxes exteriorly, protected or otherwise. The great thing is proper selection. Inside, the warden case, or humbler bell-glass, are only requisite where humidity is essential to the health of the subjects included, otherwise judicious shade and ventilation will suffice to keep a properly placed and properly potted plant fresh and beautiful for as long as it is desirable to retain it in a room. A warden case, fern case, or pot collection of any kind under glass in a parlour, should be planted by one who understands the subjects employed, and provision made for efficient drainage into an accessible bottom tray, charcoal being employed to facilitate filtration, for stagnation at the roots, combined with an atmosphere more or less unnatural, will kill any delicate plant, or at any rate reduce it to an unsightly and sickly state. But many pretty ferns may stand within a north-looking window, with overhead cover, and flourish exceedingly for a lengthy period if carefully tended, and many more, as well as numerous ornamental-leaved and pretty flowering plants, in a window with a northern aspect. For windows facing the east the range or selection of suitable subjects is still wider, while the window fronting the sunny south will only give trouble in requiring shading to obviate the scorching of most plants placed either outside or directly within for display. Little acacias, arbor vites and clematises are amongst the plants which will adapt themselves to the first position. For the second aspect camellias and begonias are suitable, so are trailing plants of "Creeping Jenny" and *polemonium* besides *viccas* and *sempervivums*, and snowdrops, narcissi, and other spring blooming bulbs. Western window plants, and those which will flourish either there or to the south, need not be particularly specified, the range of choice is so large, but it may be well to hint that *verbenas* in pots, show *pelargoniums*, *petunias*, *heliotropes*, *everlastings*, *fuchsias*, *cockscorns*, *calceolarias*, and cacti, always do best in parlours looking due south, and the same may be said of the oleander. In all cases there should be daily opening of the upper window sashes to let out gas-fouled and otherwise vitiated air, and to let in "the wind of God," without exposing the plants to a draught. There must be neither parching nor over-watering, while the leaves of palms and indiarubber plants kept indoors will be better, for an occasional sponging to prevent dust from choking their pores. Window boxes outside are a matter of taste as to construction, but if they are regarded as an ornamental adjunct, from which to rear a beautiful floral wall a good deal will be set up. Let the box be faced with virgin cork or plain (not brightly coloured or gaudily figured) tiles, and left hollow within to receive plants in pots.

which may be removed and renewed readily, and surrounded by ashes or fibre to keep them cool. Thus you will find your window gardening to be facilitated. You can train your climbers up the window sides, and let your trailers hang over as well from plunged pots as if they were stuffed into one box, the soil in which is liable to caking and souring, and you will be readily able to keep the roots of all the plants cool, each in its own best-liked compost. If you go in for a glazed protecting case or frame outside, you increase your range of employable floral subjects, and construct, in a sense, a miniature conservatory. If you do this do not omit to have the top light hinged to admit of efficient ventilation, and leave plenty of room for getting at the glass for cleaning everywhere. Those possessing available sunny windows, sheltered from wind, have the best chance of making a satisfactory and continuous floral outside display, but discriminate selection of plants and judicious treatment will accomplish much. Nothing brightens up a street more than a bit of really good window gardening, and he who provides it pleases not only himself but every passer-by, and receives praise and blessing accordingly.

Winter Cherry.—A very ornamental perennial, which will grow under shade, and produce its pretty decorative fruit anywhere in good sandy soil. It makes an acceptable conservatory or parlour-window subject, and is largely grown by the market gardeners for dinner-table display.

Witeworms. (See *Pests of the Garden*.)

Wistaria.—A deciduous climber with pretty foliage, and handsome tassell-like flowers of purple, blue, or white colour, very suitable for a south wall. There is a double flowering variety, and one with variegated leaves, which resemble those of the ash in formation. The wistaria may be increased by layering down shoots at midsummer, and these should be severed and transplanted in spring.

Worms.—Worms out of doors are good friends of the gardener, helping with the drainage and manuring of his borders materially, but they do some mischief in throwing unsightly upcasts on to grass lawns. Sweeping and rolling will remove this, and make a dressing for the grass, when the worm may be considered to have been the occasion of more good than harm. But worms in a flower-pot are most undesirable. They work through the drainage hole, work up to the top of the soil, and then drag down finely ground mould amongst the crocks, clogging all up and promoting stagnation, which kills. If a plant goes sickly, its leaves yellow, and the flower buds droop, while the soil is seemingly all right, knock that plant out of the pot, and if you find a big worm and some puddle at the bottom, lay the trouble to this. Turn him out, re-pot, and most likely things will soon mend with the plant. Pots stood out on ground are liable to the intrusion of worms, but if placed upon sifted ashes are not so much so, as the worm does not care to wriggle through them.

Xeranthemum.—The annual "Everlasting" from which "immortelles" for wreath construction are made, a hardy annual, with purple or white flowers, requiring rich soil for its successful cultivation.

Yuccas.—The sharp-pointed, sword-like leaved "Adam's Needle," some varieties of which are quite hardy enough to stand out of doors and endure the British winter. *Yuccas* like strong but sandy soil. *Yucca gloriosa recurvifolia* has curling leaves; *filamentosa* (the "Silk Grass") is a distinctive and decorative description of *Yucca*. They only flower occasionally in this country, white spikes tinged with green. Propagation by root division.

Zinnia.—Brilliant-flowered half-hardy annuals, good for border bedding or massing. Very free flowering and long lasting. *Zinnia elegans* has varieties with flowers in white and many colours, crimson, scarlet, rose, bronze, buff, lilac, and violet, some with double blossom. The seed of this should be sown in heat in early March, and the seedlings transplanted to make good stocky subjects for placing in the borders in June, the warmest situation possible being accorded them, and very well-enriched soil. The doubles make good pot plants. No British summer could be too hot for the Zinnia.

Zizyphus.—Fruit-bearing, evergreen shrubs, which mostly require greenhouse treatment in this country, and a compost of sandy peat and good fibrous loam. *Sativa*, or *vulgaris*, is known as the "Jujube Tree," and another is especially interesting because of the supposition that from its spiny branches was formed

the crown of thorns worn by the Redeemer on the Cross of Calvary. *Zizyphus vulgaris* is sufficiently hardy for out-door planting in a sheltered place. These shrubs may be propagated by root cuttings, or by striking slips of ripened wood under glass.

THE KITCHEN GARDEN.

General Hints on Vegetable Culture.

The choice of ground for kitchen gardening will be governed in a good measure by opportunity; but it should be as open and sunny as possible, and, if that can be managed, slope gently towards the south to facilitate surface drainage. Protection should be afforded against north wind by a wall or close fence, and where the vegetable ground is at the southern end of the flower garden—a very good position—a thick hedge of good height should be provided to act at once as a screen and a shelter. Holly and quick mingled do very well for this, the holly planted on the flower garden side for ornamentation sake, the quick to the south to complete the solidarity of the shelter. If the hedge be clipped pretty frequently its appearance and utility will both be improved. In very exposed places where easterly winds are frequent a close hedge or low fence on that side of the kitchen garden is also desirable. On the south and west all the light, air and sun-heat obtainable are wanted, and this should be borne in mind when the positions of runner beans and tall rows of staked peas is determined upon. The former do very well in short rows at right angles with the north hedge, or, if one long row will suffice, parallel thereto, while the peas, being hardy, may run advantageously alongside the eastern fence, with room between to get to the eastern side of the row and work the hoe, gather the crop without trouble, and permit the sun to shine down on to the roots. Position having been settled and the walks planned and made, preparation of the ground next demands attention. Perfect drainage, and the land in "good heart" are the things to be aimed at. Both can be accomplished by assiduous culture only, after a thoroughly sound beginning. A good time to start is late autumn, and trenching to a depth of a couple of feet is advised, to be repeated at least every third season, spade-deep digging being practised in the intervening years in the formation and preparation of the beds for the reception of the various vegetable plants, seeds or sets, as the case may be. The trenching should be complete, a thick covering of good manure being incorporated in the turning over of the soil, which must be left very rough for rain, frost, air and sun to work on, and may have a surface dressing of soot and salt, with sand also if the ground be particularly heavy. The subsoil if clayey should certainly not be brought to the top, but broken up and reserved at each spadeful, mixing therewith road refuse, the coarser components of the leaf-soil and manure heap, wood ashes or anything else suitable for enrichment and to assist free drainage. Light ground of good depth and loamy may be trenched from bottom to top. Forking over prior to settling the beds for planting will work in even all superficial fertilising dressings, but there should be avoidance of trampling down solid in getting the smooth surface requisite for seeding many subjects and the planting out of small stuff. Root growth should find easy passage through the ground, and be amenable to atmospheric action and equally permeable to rain. For the rest, the culture of vegetable subjects is indicated hereafter alphabetically.

Alexander.—Sometimes called *Allsander*, this old herb used at one time to be cultivated similarly to celery, and used medicinally, the stalks in scorbutic complaints, and the seeds and a decoction of the acrid root as a stomachic. Sown in rich, light soil in April and May, in drills from 2 to 3 feet apart, and thinned out to leave a foot between each plant in the row, and earthed up to blanch at a foot high.

Artichoke.—The Jerusalem is a suitable subject for growing alongside a fence, as it helps to form a screen for the garden in that position; the tubers should be planted in early spring time in rich and well-drained soil, 15 or 18 inches apart, and if there be more than one row it is best to have the rows nearly a yard from each other. They should be set 6 inches deep, and lifted for storage in autumn. The ground should then be well forked over, incorporating as much short manure as possible, and, if stiff, lightened with an admixture of sand. When the tops have reached a foot high, earth them up, potato fashion, and keep clear of weeds by frequent hoeing. If stored for use they must be placed in dry sand to exclude light and air, or the tubers will be a bad colour on cooking. The white-skinned "Mammoth" Jerusalem artichoke is far better and smoother than the irregular old purple sort.

The Globe artichoke is cultivated entirely for the sake of its immature flower heads. Sow in a hotbed in March, potting out the seedlings singly and hardening for planting out in June in groups of three or four, or increase by carefully transplanted offsets. Salt dressing is good for the artichoke. There are several serviceable varieties of the early purple artichoke, besides a number of the large green Paris section, and all bear best in their second and third seasons. The conical-headed French sort is the most esteemed in Britain, while the *Lea* variety is very much in vogue in Paris. If the tubers be not all lifted in November, cut down the decaying leaves and stalks, covering the ground a foot thick with ashes or litter, removing same in March. Eliminate all but two or three of the young shoots in each case, using offshoots to form a new plantation.

Asparagus.—An asparagus bed should be from 3 to 5 feet wide, formed by taking out the earth to a depth of 3 feet, and throwing in at the bottom over subsoil broken by digging a considerable quantity of well-rotted dung, and incorporating with the soil returned to form the bottom spit over this a good deal of short, rich manure. Then a large proportion of sand should be intermingled with the next spit, leaving the top spit almost all sand, with a liberal amalgam of salt

and some soot. Put the plants in 6 inches deep in April, a foot apart, running east and west, and when growth has commenced dress with salt, using about a quarter of a pound to the square foot. Plants may be raised from seed in drills in the bed at the end of March, or elsewhere, for placing in the bed the second year, but the heads should not be cut until the third year from seed, so if time is an object roots two or three years old will require to be obtained from a nursery. When the leaf stalks die in autumn and the dead stems are removed, spent hotbed manure may be laid over all, after forking between the rows with the digging fork without injury to the roots, and this and the summer salt dressing will be all that is requisite to keep a bed in good bearing for a number of years if it be made well out in the strong sunlight and the plants be put in originally 6 inches or so apart in the rows. Asparagus is good for cutting about when green peas begin to yield, and should not be gathered too freely, else it will run small. Always cut as near to the cooking time as possible to get the delicate flavour at its best. The pretty "grass" of the asparagus is very useful for bouquet garniture.

Asparagus.—An edible variety of the *Solanum*, or Egg Plant, a half-hard annual, extensively cultivated in Southern Europe. Sow in heat in April, prick out the seedlings singly into four-inch pots, well drained, using a compost of rich, sandy loam. Harden off gradually, and stand the pots in June in the sunshine, watering freely when growing and fruiting. The fruiting plants are very ornamental, especially the scarlet sort.

Balm.—A sweet-scented flowering herb, the leaves of which used to be in considerable demand for making a cooling drink, with a lemon-like flavour. Botanically called *Melissa officinalis*, the balm possesses very ornamental foliage, and flourishes in any ordinary garden soil. Propagated by root division in spring or autumn.

Basil.—This herb is raised from seed in gentle heat in March. Thin out the seedlings, give air freely, and plant out in a warm border of rich light soil in early June. Bush basil is the hardiest variety.

Beans.—Broad or Windsor beans crop best in a strong, heavy soil, with plenty of good short manure worked in. If sown in October on the south side of ridges running east and west, about 3 to 4 inches apart, they will get the benefit of all available sun without being waterlogged when cold rains are frequent, and come into bearing early. Seed for succession may be sown similarly, but on the level, in drills, in January, drawing the earth up to the stems on dry days when the young plants are three to four inches high, a plan which induces root development. Four feet should be allowed at least between the rows, and broccoli or spinach may be planted midway between to make the most of the space. Care should be taken not to clog the ground by trampling overmuch in planting the seed, and a board may be used during the operation advantageously. Where high winds cut across the rows, a line of string may be stretched from end to end, the seeds having been put in zig-zag so that every second plant-stem comes into contact with the supporting line on the opposite side. Topping the stems after the beans are set is good practice, burning the shoots, as this not only defeats the black aphid, so partial to the foliage, but promotes pod filling. Early Lion. Pod is a good variety for first crop, the Broad Windsor, Green Windsor, Dutch Long Pod, and Leviathan being better for late successional sowing, which may be continued until towards the end of April. Runner beans should be grown in deep rich soil alongside a fence with a southerly or easterly aspect, or in the open in double rows 3 inches apart with 3 inches also between each bean. Sow 2 inches deep on a good thickness, say 3 inches, of soil superimposed upon well-rotted manure laid upon a worked subsoil, in early May, or put out young plants raised in boxes from seed in a frame for mid-May starting in the garden. For climbing support, a double row of light poles should be stuck along the lines of runner plants, inclining towards each other and crossing towards the top, horizontal sticks being dropped into each junction and tied with tarred string to make all taut against

strong wind. Topping the shoots when the summit of the pole has been reached induces bushy fruiting growth. It is well to protect against possible late spring frosts a little at nights at first, and in September when the bine is in good bearing a loose night covering will often save the beans for a week or two of further yield should a premature cold snap come, followed by open weather. All seedsmen have good strains of the popular scarlet runner, also of the white Dutch runner and the red and white Painted Lady, a very pretty variety, but less prolific as to pod production. Copious root watering in warm weather, at night or early morning, is good for runner beans. Dwarf or French beans may be sown in mid-April in sunny positions or a little later where sun warmth does not reach so well, good rich loamy soil being provided, in rows a foot and a-half to 2 feet apart, the seeds being put 1 inch underground in batches of three, each batch being 9 inches to a foot from the next. When slug dangers are past, any more than one plant remaining in each batch may be eliminated, leaving only the strongest looking. Draw the soil towards the stems on either side as the plants grow, carrying the ridges as high as possible. Sir Joseph Paxton is one of the best of the early French beans. Canadian Wonder should be sown a little later, say in the beginning of May. A dressing of soot and fine lime will retard the progress of snails and slugs, which are very fond of young bean shoots, while adjacently laid little heaps of brewers' grains will attract them, when they may be caught by candle light, and killed in salted water. Manual waterings at the root in the growing period will add to the productiveness of those and all other beans. For haricot beans the pods must be allowed to remain for the seed to ripen, but the faster the pods are gathered for cooking in the fresh state the longer the beans will continue in bearing.

Beet.—Turnip-rooted is the best of the early red beets so useful for salading and pickling, and should be sown in the beginning of April in drills rather over a foot apart and a little less than an inch deep, thinning out to 8 inches apart. A bed in which previous cropping has taken place, and which was heavily manured, therefore, suits beet, the soil being light and well pulverised, but if this be inconvenient the ground should be dug out, trenched, and manured with well-decayed dung at the bottom. A light dressing over the bed when the plants are a few inches high will be of service, and weeds should be kept down. Red Castianaudary, Dell's Crimson, and Cheltenham Greentop are good main crop sorts, and may be sown in the middle of May. White or spinach, grown for the tops, which are cooked spinach fashion, should be sown in April and August, the latter sowing being for a winter supply. The leaf stalks and midribs of this species are sometimes stewed and eaten like sea-kale. There are yellow beets, not appreciated in the kitchen, and white sugar beets, not grown in English gardens. In lifting the roots in October great care should be taken not to bruise the skin or break off the tap root, and the leaves should be cut a good inch above the crown to prevent bleeding, which would spoil the colour of the root in boiling. They should be stored in a dry, frost-proof shed, laid on sand, with sand over each variety.

Borecole.—Borecole, also of allied kale and winter greens, belongs to the great Brassica family, and is cultivated for the leaves, which stand all but the severest frost, and for the sprouts in spring. The borecoles do not take so much out of the ground as cabbages, and may be planted after peas when the haulm has been cleared without further manuring, or may be put in between rows of potatoes or beans. Sow in a seed bed in April or May and again in August. The Buda kale should be seeded in May and transplanted in September. Dwarf curled greens are the old Scotch curly, close, compact, and curled; the tall green curled runs to 2 or 3 feet high, and cooks well after frosting. Cottage's kale is a variety of the Cavalier cabbage, and a hybrid between Brussels sprouts and one of the kales, a very tender fine green, reaching as much as 4 feet high; it must be planted wide apart. Purple, or sprouting borecole, is very much like the all green curled kale in

everything save colour. Ragged Jack does very well in cold and exposed positions; variegated borecole is ornamental as well as useful; Jerusalem and Egyptian kales are both excellent, and the latter very hardy. All the borecoles are the better for having the soil drawn up to the stalks as growth proceeds, and should be hoed frequently, as stirring the ground surface is very beneficial to the plants. The sprouts are good for use as long as their stalks will snap off easily.

Broccoli.—Broccoli is a variety of the cauliflower, differing therefrom in having the flower stem longer and not so fleshy, and head not so compact. It does not attain the size of the best cauliflowers, nor does it furnish such delicately flavoured eating. It needs good, rich, well-tilled soil, and should be sown under glass in early spring for autumnal use, and in late May in the open to stand until the following spring. The broccoli is harder of constitution than its congener the cauliflower, which it succeeds in cropping, and may be cut up to Christmas, and even later. Broccoli must be planted firmly and about a foot apart, and when the flower is forming have a leaf or two broken over the head for protection, save in the varieties which curl their leaves in naturally. Early Purple Cape, Early White Cape, Early White Waterlander, Autumn Giant, are among the best sorts for autumn and early winter cutting. For late winter and spring use the Ponzance, Leamington, and Purple Sprouting may be recommended, and for the latest supply Late White Protecting is good. Strains of these and numerous other descriptions are offered by all the seedsmen. The young broccolis should be well watered after transplanting from the seed beds until established, and those standing the winter have their heads bent down facing northwards to check root action and render them less succulent during frost, besides facilitating shelter with dry litter or bracken when the weather is very severe. The spring varieties come in most acceptable for the table at a time when the supply of the finer vegetables is scanty.

Brussels sprouts.—A protracted growing season is essential to the maturing of these excellent vegetables, which belong, of course, to the Brassicas. March sowing in light soil in a cold frame, and transplantation into deeply-worked and well-enriched ground will produce stems a yard high covered with close sprouts to the extent sometimes of a peck a stalk. They should be planted in rows a foot asunder and each plant a foot apart. The cut off the heads as soon as the stems have arrived at the full height, so as to conserve all the strength of the plant for the perfection of the sprouts, others retain the head as an umbrella for the side-growth. The earliest sprouts come in for the table in November, and they continue to yield in improving quality until Lady Day. It pays best to get good reliable seed of this and every other vegetable, and this is assured by going to a reputable firm.

Cabbage.—Cabbages proper have their inner leaves growing close to the stem, and each layer below tightly superimposed, green outer leaves blanching those within almost white at the heart. They and their allies prefer a loamy soil, well drained and well manured, and can assimilate a lot of moisture in dry weather, and copious waterings. Liquid manure during the growing period. For spring cabbage a sowing should be made in beds of friable mould during the third week of July, the seed being placed in drills. Transplant later to prepared ground 18 inches apart and earth up to steady the stalks and protect the roots as growth goes on, hoeing frequently, and dressing the surface with either short manure, lime and soot mixed, or any favoured manufactured fertiliser during showery weather in early spring. Earliest of A.S. and Early Dwarf are capital spring cabbages. Christmas Drum-head should be sown in the beginning of April, so should the St. John's Day variety, while Early York may be sown in May. The coleworts, sown in June and early July, come in for autumn cutting. Rosette and Hardy Green are good sorts, and will do in rows rather more than a foot apart, allowing 3 inches between each plant. During August Enfield Market may be sown, as well as Nonpareil, and planted out the next month where peas or beans have been cleared. In

all cases lime, salt, and soot mixed may be applied as a dressing to the seed bed with advantage, and dusted on the seedlings after a shower to prevent attacks of the cabbage fly. Weeds should be kept down by frequent hoeing and hand-picking, and caterpillar minimised by continuous hunting and lime-dusting when the dew is on the leaves. Red or Milan cabbage, so popular for pickling, should be grown from seed sown at the end of July and again in April, and transplanted later in due course, the latter culture being similar to that of the other cabbages. The Red Dutch is a general favourite, and other serviceable sorts are Utrecht Red and the Dwarf Red, both rather smaller but firm and fine flavoured. The red cabbages must stand in the ground until the hearts are quite hard.

The Portugal cabbage, sometimes called Couve Troughuda, is a Brassica of very distinct type, and somewhat tender of constitution, requiring to be sown in spring for autumnal use. Only the fleshy leaf ribs are eaten, prepared for the table like sea-kale. The Portugal likes a good rich loam to grow in.

Capitulum.—Ornamental plants, especially in autumn, when the fruits are ripe. They should be raised from seed in a hotbed in February, the seedlings being pricked out into single pots of light rich soil, and given successive shifts until each occupies an 8-inch pot. They require a genial temperature, and may remain in the frame until the fruit begins to change colour, though in the extreme south they will flourish in the later stages in a warm border if planted out in June. The pods ripen in September, and will keep a year or two in a dry room. Capsicums like plenty of water and some liquid manure in dry weather, and for pot culture should be given good drainage, and frequent overhead syringing. In the green state the pods are employed in salads and for pickling, or used for making Chili vinegar, either ripe or unripe. Fully ripe and powdered they furnish cayenne pepper. The Chili and Bird pepper are both shrubby subjects, and require peat in the compost, and will endure through the winter if kept dry and not retopped. The Bell pepper is wilder than these latter, and is admirable for salading or eating with cold meats.

Cardoon.—A perennial from the Mediterranean shore, related to the artichoke. The inner leaf-stalks are tied closely together around the stem in autumn and blanched for eating, the whole being bound in straw bands except the tips. Sown in shallow trenches in deep rich soil, and a warm situation in May, and kept copiously watered, cardoons are ready for the full blanching process after a few gradual earthings up by September. During severe frosts the exposed leaf tips need protection. On gathering trim away all but the blanched heart with a sharp knife, when the "chard" or edible portion is ready for the cook. The Paris cardoon, the largest of the tribe, is the most tender, but the prickly leaved and Tours varieties, as well as the red-stemmed cardoon, are all held in esteem.

Carrot.—Soil for carrot culture should be very deeply dug, and manured in the autumn, at the bottom of the trench, and if at all stiff the land must be lightened with sand and peat. Break up the surface with a rake in spring, working in a good inch dressing of wood ashes, and leave all smooth for seeding in shallow drills, covering the seed very slightly with finely sifted soil, and pressing down with the back of the rake. Powdered chalk and coarse salt may be incorporated with the top dressing before sowing in early April. Thin out to four inches apart in the case of the early Shorthorn variety, which is of delicious flavour when young, and water well from soon after the leaves commence to grow, taking great care to keep weeds down. Larger carrots want correspondingly more room, and the improved Altringham variety is a capital main crop sort. It can be sown till after midsummer. Liquid manure applications assist development. After October is over no carrots should be left in the ground, for retention there tends to make them crack. Loosen the soil with a long-tined digging fork, and draw each root carefully, cutting off the tops and storing them in a cool place for use in the kitchen. Light soil, deeply drained, with a layer of rich manure well down at the bottom of the pre-

pared bed, will give good clean carrots, free from forking, which is always undesirable. Before the general harvest, carrots should be drawn as requisite regularly, leaving those that remain to mature more and more free to feed and thicken.

Cauliflower.—Cauliflowers, like cabbage, require a deep rich ground to grow in, only more so; and, being somewhat tenderer of constitution, they should be planted in a position sheltered from the north. Otherwise their culture is very similar, as to seeding, transplantation, and the rest, to that requisite for the summer sorts of cabbages proper. Cauliflowers from Corsica and the Mediterranean coasts, cauliflowerers have been esteemed as excellent for ages. The June eating sorts, of which the Dwarf Erfurt and Snowball varieties are very good types, should be sown in a warm border, with some shade from direct noon sun, in the middle of August, and transplanted into cold frames to stand the winter in October. If frames be not available, then a position on a south, sloping, well-sheltered border will serve, the soil being fine and rich, and protection being afforded during severe frost by hurdles, mats, or some other convenient contrivance. Finally transplant into the prepared perfecting ground in May. Walcheren and Magnum Bonum are fine mid-season sorts, and Autumn Giant is grand for late cutting, and these should be sown and grown on accordingly, as in the case of successional cabbages. Good root watering, with occasional stimulation by liquid manure, is advisable in droughty weather, and on the commencement of the head formation the leaves should be bent over to keep the hearts clean and white. Draw up the earth to the stems when it is dry and friable, take off all decaying leaves, and hoe often to prevent the establishment of weeds, and let air and warmth down to the roots. Also watch out for caterpillars closely, for, if permitted to secure a lodgment, these pests will frustrate all your efforts.

Cauliflower Broccoli. (See Broccoli.)

Celeriac.—The turnip-rooted celery is cultivated for its tuber alone, and therefore does not need blanching or trench growing like celery proper. It is a hardy biennial subject, and is employed either sliced in salads or for cooking, having the peculiar celery flavour. Sown and transplanted early, it may be put out into ground in May, when it will soon develop its irregular root knob, which will in some cases attain a weight of over three pounds. The roots should be lifted before the beginning of November and stored in dry sand.

Celery.—Sow seed in a moderately warm bed under glass in March for all ordinary purposes, or a month sooner if a very early table supply is required, using good rich soil. Transplant by pricking out the seedlings when they have reached 3 inches in height, which will be about 5 weeks from the time of putting in the tiny seed. They may be transplanted either into pots, or a cool frame, using a compost of loam and well-rotted dung, the latter in preponderance. Water freely to obviate lanky growth. Planting out in the open prepared trenches should take place at the middle or end of May, a warm part of the garden, being selected. Take out the earth to a depth of 18 inches to 2 feet, allowing a width of fully 15 inches. At the bottom lay 6 inches of well-forked hot dung to stimulate the plants, putting a good covering of fine soil over the manure, and heaping the remainder of the removed mould neatly along the banks for earthing-up purposes later. Put your celery in 8 inches apart, planting firmly and carefully without breaking the ball, and then water as liberally as you like, remembering that the genus is a marsh dweller naturally. Do not begin the earthing-up too soon, but get a sturdy start, applying liquid manure or soot water occasionally to assist you. When your plants are 15 inches high remove suckers and side growths cleanly, and tie up the leaf stalks lightly towards the top with bass, very carefully banking up the earth from the ridges in dry weather, and avoiding the introduction of soil amongst the leaf stalks. Make your banks gradually by repeated heaping, sloping the earth down evenly until the ridge reaches almost to the leaves. The final banking should be completed before the first severe frost comes, and then dry litter or fern may be lightly laid

over all for protection, and removed on mild days to permit the leaves to dry. So you will get good thick, firm heads, well blanched and crisp, and lasting over a long time of yielding. A dressing of dry lime upon the soil employed in earthing-up will keep the worms and slugs from troubling, and a little quicklime in the water used occasionally for supplying root moisture is also effectual in the same direction, while, should the celery fly put in an appearance, soot may be dusted advantageously over the foliage when it is damp. In gathering celery commence at the end of the row, removing one head at a time by forking down to loosen the root without disturbing the remainder of the crop, and pulling up from well below so as not to damage the stalks. Grow from the best quality of seed, whether you are using the white or red varieties, the former being most in favour.

Chervil.—A useful salad herb which should be sown in drills over nicely-manured ground in March for summer use, thinning thereafter, or in August, in a warm dry situation to stand the winter, the latter crop requiring protection against severe frost.

Chicory.—The tender roots of chicory, succory, savory, or wild endive, the roots of which are cultivated for grating to amalgamate with coffee, are in request for winter salading. Seeds are sown in drills on a border in May, the plants being thinned out to 4 inches apart and allowed to develop. Then, in August, all the leaves are cut off to within an inch of the ground, to promote new growth. About the commencement of October the whole plant is lifted with a digging fork, the larger leaves again cut away, and the roots pruned. Then the chicory is planted in dry, light soil, closely in shallow boxes, and covered with litter to protect from frost, watering when needful. The plants may be taken, boxes and all, into a warm, dark shed or cellar, to blanch and complete preparation for the table, the leaves being usually cut when about 6 inches long, and quite crisp and tender.

Chilli.—Chilli fruit, like that of the capsicum, is cultivated in the greenhouse for its pungent properties as a pickle, and for infusion cut up in vinegar. The seed is sown over gentle bottom heat, and the young plants potted off singly and shifted later into larger pots. If the chillies are to be gathered green, the plants may be placed in a warm border in June, but should the fruit be wanted to fully ripen it must be developed indoors under glass. (See also Capsicum.)

Chives.—Cultivated for their succulent leaves, onion-like, but rather milder in flavour, and very useful in soups, also for salading. A perennial, propagated by root division autumnally, the clumps growing nicely in ordinary soil with little attention. The tender leaves are cut up by some turkey-raisers for admixture with the food of their newly-hatched birds.

Colewort. (See Cabbage.)

Corn Salad. Sometimes styled the "Lamb's lettuce," this weedy annual is employed in France and in a small way in this country as a winter and early spring substitute for lettuce in salads. Should be drilled in upon a warm border in September, in rich light soil, and weeded and watered as may be needed, and litter must be placed over the plants in very frosty weather. The leaves must be picked when young and tender to afford satisfaction.

Cottage's Kale. See Borecole.

Cress. The seed of the garden cress may be sown thickly in shallow boxes of light soil at any time, or in the open ground from March to October, on a moistened surface, and covered either with a sheet of glass or stretched paper to assist germination. In winter the seed pan may be placed on a hotbed. The seed leaves only are eaten, with those of white mustard, as small salading, or they make an agreeable accompaniment to lettuce. What we commonly call cress is a Central Asiatic annual; the Golden or Australian Cress is eaten with the leaves a little more advanced in growth, and may be sown out-of-doors all through the late spring and summer. Curled or Normandy Cress is hardy and fine flavoured, and comes in for garnishing as well as salad purposes. It should be sown in drills in a sunny border and treated and gathered somewhat like parsley.

Cucumber. Cucumbers can be grown under glass, at any season of the year, by adjusting the temperature and moisture of the soil employed and the surrounding atmosphere to their needs. The frame of the forcing house in which they are cultivated requires to be maintained at a temperature ranging from about 70 to 75 degrees, and never permitted to fall below the former. This is the first essential of success. When such a condition can be managed by warm water pipe heating or hot-air flue medium, cucumber cultivation becomes a simple matter. But a great many amateurs have to rely upon hot beds, which must be constructed according to an approved method. A sufficiency of fresh stable manure must first be procured, short saturated litter and dung being its principal components, and the whole in a full state of fermentation. This should be well shaken and turned over at intervals of a few days, at least three times, amalgamating dry leaves and vegetable refuse thoroughly with the admixture in the later stage of preparation. Then pitch-fork the whole, steaming hot, into a good deep pit or frame, or range of frames, standing fully exposed to the sun and sloping southward in a sheltered position. Place on the top light or lights and leave all to settle for a few days and bring the heat to the top. Next tilt the light up a little to allow all the accumulated rank steam to escape. When the contents of the frame have cooled down to about 55 degrees in temperature, a covering of good rich loam may be spread over all 3 inches in depth. The surface should be as much as 18 inches below the level of the front or lower wall of the frame. When you have reached an ascertained steady temperature of not more than 80 degrees on the top of the hotbed (below the superficial soil-dressing), which may be tested by plunging the bulb of a garden thermometer 6 inches down, you may proceed to make mounds or hillocks of rich soil to receive the cucumber plants, raising these so that the leaves at maturity will approach within 6 inches or so of the glass. Your cucumber plants, raised from good seed sown in single pots of leaf-soil, drained each with a lump of fibrous turf, may be planted on the mounds when the second pair of leaves are well formed and the first shoot has commenced to move, the hillocks having meanwhile warmed equally. Hillock each hillock a little, basin-shaped in the centre to facilitate watering. Watering, with restricted ventilation, will raise the heat by increasing fermentation, less moisture and more air administered will in a corresponding ratio cool the hotbed. In giving air you must be careful to proceed so as to avoid draught or uneven distribution of temperature, and all will go well. Experience herein, following the principle laid down, will soon enable you to proceed with confidence. Your growing compost may well consist of two parts yellow fibrous loam, containing knobs and lumps of mature turf roughly broken and laid towards the bottom of the bed, and one part good peat, the remaining fourth being leaf soil. To this add clean sharp sand to the extent of a twentieth. Let the cucumbers, in the pots wherein they seeded, stay in the frame 3 or 4 days unplanted, to get into the same condition of soil warmth as that you will set them at liberty in, and so receive no check. When the young plants have formed two joints, stop by pinching off above the second, both the shoots remaining being again pinched back above their third joints. Succeeding young shoots should have their tops pinched off also with the finger and thumb at the second or third joint. When growth is well under way, select three or four principal shoots to form branches of the cucumber vines, laterals of which should be allowed to fill the frames and bear fruit. This filling of spaces at command with selected runners having been accomplished, all new runners and shoots must be eliminated as they form. Keep moist by sprinkling the leaves from a rose, always using tepid water, and shade from noonday sun to prevent scorching, giving a little air at the same time cautiously. You want all the light you can obtain without sunburning, and when water is given at the roots it must be tepid if you would freely succeed and keep the plants always healthy and in good bearing.

The thing to strive for is air, moist and fresh, and yet constantly at the temperature indicated. Sunheat will give you a deviation to 5 degrees extent at least higher at mid-day, even if you are particularly cautious as to putting air on in the morning and withdrawing it at the proper time, but this is a natural condition of plant life. In a forcing house where the heat is regulated by an easily governed boiler or by fire-heated flues, it will be necessary to maintain the moisture by waterings and floor sprinklings, and the cucumber vines, grown in borders over, or near to, the flues or pipes may be trained to trellises to hang the fruit down naturally and straight. In the frames glasses will be necessary to secure straightness for the finest fruit, but, with quick, healthy growth achieved by practicing the precepts here expounded, there will be little malformation that matters. Gherkins, and some fairly-long hardy outdoor cucumbers, of which seed may be readily obtained, give satisfaction if grown in a sunny yet sheltered position in good hotbeds in the garden, the young plants being started off under bell or handglasses and lightly syringed overhead in the evenings to promote humidity as much as possible. The plants being maintained in vigour, their thick large leaves will give the requisite shade to the running and fruiting shoots. The fruit not introduced into training glasses may be laid on pieces of slate to prevent discoloration underneath, and all decaying leaves should be removed.

Curled Greens. (See **Borecole**.)

Custard Marrow. (See **Marrow**.)

Egyptian Kale. (See **Borecole**.)

Endive.—A very useful salad plant, easily grown in light, porous soil, well trenched, and enriched, in any sunny garden. Seed may be sown in shallow drills on a pulverised bed surface in June, raking all even. Thin out the weaker seedlings, leaving 18, more robust plants about a foot apart all ways. When fully grown, the plants, having had the soil drawn up to the roots, during development may be blanched by tying up and placing inverted flower pots over them. The process takes a week or more, and it protects against injury from frost as well as giving the requisite whiteness to the heart leaves. Batavian endive is a satisfactory sort to grow and of fine flavour, its lettuce-like leaves having an appetising bitterness; but the curled sorts, green, white, and the New Moss Curled are in great favour if less hardy. The staghorn variety of the latter will stand outdoors well on into the winter under a south wall. Some protection must be provided for the crowns in severe weather.

Fennel.—Fennel, cultivated as an ingredient of sauces and salads as well as for pickling, may be raised from seed sown in April, and covered lightly with soil. Transplant the seedlings a foot apart and pick off all flower stalks as they appear in order to ensure fine leaves. A good bed will last for several years. The leaves possess valuable digestive properties, and are a corrective of flatulence.

Garlic.—This powerfully pungent bulbous perennial, a very little of which goes a very long way, requires similar culture to the shallot, being propagated by separation of the cloves of which the bulbous root is comprised, and setting them out in spring in rows in rich and friable soil and a sunny situation, planting 3 inches deep and a few inches apart. Weed the bed well, and dry when ripe in the sun for storing. A small clove of garlic inserted in the knuckle of a leg of mutton will permeate the whole joint, and the mere rubbing over of a warm dinner plate with a cut clove will affect whatever is served therefrom with the strong garlic flavour.

Greens. (See **Borecole**.)

Horseradish.—Horseradish requires rich, deep soil for its proper cultivation, and a moist situation suits it best, the object being to obtain long, straight, smooth root growth. Sets or pieces of root should be planted at the bottom of a deep and well-manured trench, and a single shoot only allowed to grow above ground at one time in each case. In digging, the earth should be carefully thrown from the root to be gathered, so as to get up the full length without damage to it of the stick. It must be harvested before frost

hardens the ground when wanted for winter use, and stored in damp sand.

Jerusalem Artichoke. (See *Artichoke*.)
Jerusalem Kale. (See *Borecole*.)
Kale. (See *Borecole*.)

Kohl Rabi. The turnip-rooted cabbage, as Kohl Rabi is often called, is half a cabbage and half a turnip to look at, having a bulbous stem like the latter, and producing broad, cabbage-like leaves. The root, when eaten young, is very palatable, and the Kohl Rabi stands frost as well as drought, so that the leaves often come in handy for the pot. Sow in drills or in seed-bed in spring, and transplant later to a foot apart, watering if need be till growth begins, after which nothing but occasional hoeing will be wanted. Early White and Early Purple Vienna are both serviceable sorts.

Lamb's Lettuce. (See *Corn Salad*.)

Leek.—Leeks may be sown in February or March in wide drills, on a well-prepared and well-enriched bed of light soil along with onion seed, the young onions being drawn for spring consumption, leaving the leeks to stand and mature. The soil later should be drawn up to the leek stems, to promote blanching. A better plan is to grow them in shallow manured trenches, celery fashion, setting each leek from a seed bed in a dibbled hole in a centre row, 6 inches apart, and just covering the root fibre at the bottom of the hole with fine soil. This leaves room for swelling, and subsequent earthing up, putting light soil lightly near the stem in the process, will produce fine white stems. Liquid manure waterings suit the leek well, and the crop should be mature by September. London Flag is a capital sort. Scotch or Musselburg leeks attain a large size and are very hardy. Large Rouen are amongst the best for main crop, and Early Netherlands come in first for use. For exhibition purposes leeks are sown under glass early in the year, hardened by transplantation and cultivated in protected and richly manured trenches.

Lemon Thyme. (See *Thyme*.)

Lettuce.—A hardy annual, whose crisp and juicy leaves are of old dietetic renown. It requires rich friable soil, and a nice open situation, but not too much exposed to strong sunlight, and should be sown broadcast on nicely prepared and narrow beds from March onward, thinning and transplanting carefully, so as to leave each lettuce at least 6 inches apart. Hardy cabbage kinds may be sown early in August to stand the winter, and removed when handy for the purpose to a warm border, allowing 8 inches between the plants. These will be at their best for cutting in May, and for succession seed may be sown in a cold frame in February, the seedlings being pricked out in a frame for later transplantation. Thereafter the open air sowing will suffice. Early Paris Market is a delicious sort for spring sowing, and Hammersmith Hardy Green stands the winter well. Other satisfactory cabbage lettuces are Drumhead, Tennis Ball, Brown Dutch, and Neapolitan, a splendid summer strain. The culture of the cos lettuce is the same as that for the cabbage varieties, and White Paris Cos is amongst the best for summer cutting. Sugar Loaf Bath Cos is handsome, and Brown Cos capital for winter use. Lettuces will greedily devour liquid manure applied to the roots during the growing period, and quick development improves the flavour and adds to the leaf crispness. The cos lettuce leaves may be carefully drawn together when growth is well advanced and tied towards the top with soft bast to help heating and blanching.

Manuring.—Systematic digging and trenching after the annual muck-spreading will accomplish most of the manuring essential to successful vegetable culture, save in the case of special subjects like asparagus, especially if followed up by mulches of short manure at planting or seeding time. The latter is a good plan to go on all summer planting, and with regard to sowing any but small seed, such as that of onions, parsley, carrots, etc. Gas lime makes a fine dressing for fallow land on which cabbages or turnips are to be grown, and this, like stable manure, should be on the ground for some time prior to digging in. Nitrates or other clean fertilisers may be advantageously applied to quick-growing root and green crops when the

growth is well started and they can absorb the nutriment therefrom. Peas, onions, kidney beans, and cabbages are all voracious feeders, and the ground in which they are cropped ought to be first enriched as much as possible, but it is wasteful to apply fertiliser to leguminous crops after the stalk and bine have started, as pea and bean plants get all the nitrogen they need from the atmosphere. Manure from the stable anywhere where seed feeding has been going on should be fully fermented before being applied to the ground, or there will assuredly be a very undesirable weed crop. Old hotbed manure is a grand thing for the land, and, generally speaking, farmyard manure and road sweepings, both in the best condition, are preferable for application to the kitchen garden to manufactured soda nitrates, ammonia sulphates, or superphosphates, however the freedom of these latter from strong odours and their easy distribution may tempt one to make use of them. Seaweed, blood, crushed bones, sewage, nightsoil, and many other kinds of animal and vegetable refuse may be utilised in various ways in the ground, the great thing being to employ them intelligently and methodically.

Marjoram.—Pot marjoram and winter sweet marjoram are hardy perennials, which grow well in warm, dry soil, and may be divided and planted in spring or autumn. Cutting the stems of the plant should be done in summer, drying in bunches in an airy shady place. Knotted marjoram is rather a tender subject, and should be raised from seed in slight heat in March, and transplanted later to a sunny border.

Marrow.—The vegetable marrow varieties of the edible gourd genus are extensively cultivated, and must be first raised from seed sown in a hotbed or greenhouse, in light sandy loam soil, the seedlings being transplanted into single rows to harden off ready for planting off on a sunny bank sloping southwards or an old rubbish heap or dung heap, being given a rough mound of rough turf loam and broken sods to run their roots in, kept well watered and clear of weeds. They abominate stagnant moisture, but cannot very well receive too much if the root drainage be complete. It is not necessary to make a hotbed specially for marrows, any raised collection of well-shaken refuse will serve to give them an elevated position in the sun and furnish a good growing start, but it is admirable to cover the young plants with a handglass tilted a little at first, or otherwise afford shade and protection against mid-day sun and possible night frost. Late May or early June is quite soon enough for outside planting. The Cream, White, Long Cream, and Long Green are all good sorts for cropping. The curious flattened and scalloped-edged Custard Marrow eats sweet and requires similar culture to the oval and cylindrical sorts. The huge pumpkin or squash needs a lot of room for its great rambling shoots. It sometimes enormous fruit is not gathered immature for the table, like that of the Marrow, but ripened for mashing, and pie or jam making.

Milan or Red Cabbage. (See *Cabbage*.)

Mint.—Any little piece of mint root will establish itself readily, and this very useful herb should be grown in sufficient quantity in good soil, in a damp or shady border, well pruned in between a wall and a deep edging or the roots will invade neighbouring territory. March is a very good time to plant. Just when the bloom stalks begin to show cut and dry in the sun for bunching and kitchen use. In late autumn cut all the remaining stalks level with the ground and dress the surface with a good inch of fresh soil. Spearmint is of course the most called for in the kitchen, but peppermint and pennyroyal are both worth cultivation and are easily managed when the conditions are favourable. The root runners of the peppermint keep above ground.

Mushrooms.—Most people like nicely cooked fresh mushrooms, and these delicious fungi may be grown easily all the year round by making upshot beds indoors or out and artificial spawning. A very good situation is a warm damp cellar or any outhouse where the atmosphere is moist and close. The foundation of any mushroom bed should be a sufficiency of well-rotted stable manure, turned over in the sun three or

four times to sweeten, and well mixed with about a quarter of its bulk of good loam at the last time of turning. The bed should not go above about two feet high and be given a gentle slope and well beaten down with the back of a spade. Smaller beds may be made up, sloping from front on wall, on shelves in shed or cellar, always getting about the two feet depth. When the bed temperature is down to about 75 degrees two inch bits of the spawn bricks to be had of all florists should be broken off and inserted freely over the surface of the manure, pressing down and covering with an inch of good garden soil. Then cover with an old mat or bag to exclude all light, and if the place be moderately warm and your spawn is good, you will in six weeks or so find mushrooms under the mat. Then, and not till then, you may water with warm or tepid water from a rose can, and a salt dressing over the beds will add to their fertility. Outdoor mushroom growing presents little difficulty. Stable sweepings shot together, then tossed into a conical heap, soon become dry enough for the purpose in hand, so that flat beds, or what are more customary out-of-doors, long conical ridges, can be quickly made therefrom. These beds or ridges must be made up when the material is warm up to about 60 degrees, as they must be trodden or beaten down quite firmly, a process which will greatly reduce the heat. After they are made wait a day or two to see how they heat, and when they fall to 75 degrees or a little lower, spawn and cover them with an inch, evenly all over—of good yellow loam, then cover all with a few inches in depth of short litter. Should a rainy period follow, the beds must be protected from excess of water, indeed they are best without any until mushrooms appear. A covering of mats or easily removable platted straw over the beds or ridges is very helpful. Never use stable spawn, got it fresh from the grower or a reputable garden requisite establishment, or you will be badly disappointed.

Mustard.—As an accompaniment of cress for small salading this is indispensable, and should be sown similarly, broadcast, in pans, boxes, or on borders, the soil made smooth and moist. Press the seed upon the surface, but do not cover, or the stalks and leaves will be gritty. Water gently with a fine rose after the leaves are first formed, and shade from the sunlight to keep green. Sow often and cut quickly.

Onions.—Autumn sown onions escape the fly which is such a pest to this esculent. Give them good soil, well tilled, and sow in drills, 9 or 10 inches apart, thinning afterwards freely. This will give plenty of spring onions for the table, and with weeding and hoeing later large bulbs for maturing and drying for winter use. Dressing with soot and crushed common washing soda staves off the maggot and promotes fertility. Seeding in February or March, covering thinly with fine soil, will give successional growth. The White Lisbon is fine for spring salading, Golden Globe and Tripoli sorts come in for summer use, the Giant Rocca is grand for autumn sowing. Fresh manure, except when trenched deep down, is not reckoned good for an onion bed, but wood ashes and charred refuse are excellent for working in before sowing. At maturity, that is when the leaf stalks begin to die down in autumn, pull up the bulbs and let them dry on the ground for a good week, turning occasionally, before storing away where frost or damp will not get at them. The Spanish onion is preferred by many for its mildness, and the Giant Madeira, of great size, is also a favourite while the silver-skinned is perhaps the best of all for pickling, and Blood Red very handy.

Parasley.—March sowing for summer supply and June seeding for winter use is the practice with this very useful biennial garnishing plant, which may run along the edges of borders advantageously. Take out a narrow little trench a foot deep and lay along the bottom broken brick rubbish and old mortar, filling up with good loam, and sow the seed thinly in drills. Cover lightly with sifted soil and water very gently from a fine rose, and thin out the plants, watering freely in dry weather thereafter.

Parsnip.—The Parsnip is cultivated in deeply trenched sandy soil, the manure being well worked down into the subsoil to prevent forking of the roots. Sow in lines, say 25 inches apart, thinly in early

March, covering the seed very lightly with finely sifted soil. Thin out when 2 inches high to not less than 8 inches apart, hoeing freely afterwards. Take up the roots in November, cutting off the tops before storing away in a cool cellar. They are hardy enough as a rule to withstand frost if left in the ground and covered lightly with bracken, but would begin to grow again in February if permitted to remain, and quickly deteriorate. Large Guernsey and the hollow crowned varieties make clean and handsome roots, nutritious and fine flavoured.

Peas.—Ground for pea cultivation should be trenched to 2 feet deep, during the winter, and left quite rough for the frost to get well at it. Work in a lot of good fresh manure at the digging, and fork over freely before planting, which should be done without solidifying the earth by trampling too much. Burnt garden rubbish and wood ashes are very good for incorporation with the mould in which peas are sown. A friable and calcareous soil is preferable for this admirable leguminous ascult, and dry days are best for the sowing, which may commence in November in the most sheltered positions, Ringleader and Little Gem being suitable sorts for the earliest crop. Sow in drills 2 inches deep, covering with nice light soil after gently pressing each seed down, and "stick" when 4 to 6 inches high, drawing up dry soil in ridges to the stems, which affords shelter and induces good root growth. In frost a little bracken or clean litter may be laid over the young upspringing plants. In January a second early crop may be sown, and Little Marvel in drills towards the end of February 3 inches deep. Successional sowings to continue the yield right on into autumn can be made according to requirement. The wrinkled marrowfalls go in very well in March, and Ne Plus Ultra is fine for the latest c-cropping, being a quick, free grower. English Wonder, American Wonder and some other dwarf kinds will do without sticking at all if the soil be well ridged round the stems. Mulching with good short manure is good for peas in dry weather, and copious root watering also if the soil be deeply worked and drained. Leave as much room as you can between the rows, and run them north and south for the main crop planting, cabbages, French beans or onions between to occupy the surface intervening.

Potatoes.—Potato culture is the most important of all kitchen garden work, and should therefore be approached with full understanding and systematically. To begin with, the ground must be rich but sweet. Soil heavily manured for a previous crop such as celery, then thrown up roughly for frosting in the winter, suits potatoes well, for fresh manuring, either at planting time or subsequently, tends to make the tubers "soapy." Sandy soils previously enriched make the best flavoured and finest conditioned potatoes for the table, if not the heaviest crops. Charred vegetable refuse is valuable for working into the surface soil when the "sets" are planted, and a sprinkling of dried wood ashes along the trench and over the "sets" will often be helpful in warding off disease. Never attempt planting potatoes too early except for forcing, lest a light frost blacken all the promising row of peeping leaves and put you back weeks later than your more prudent neighbour who has deferred operations. The Ashleaf sorts are among the best of the early kidney-shaped potatoes, though Snowflake and some others of the white-skinned section are very good. Beauty of Hebron is a fine pink-skinned kidney variety for early yielding, while for a later crop among the kidney Bonum is a capital white and "La Americana" a profuse yielding coloured sort. Select round kinds are Early Market (white) and Triumph (tinted) for first crop, and for main crop and late the old "Regent" and Magnum Bonum (white), also Purple Prince (a deep-coloured, heavy-yielding kind). To get a very early outdoor supply, a small bed of Ashleafs may be planted as soon as in January as the ground will work. On a south border under a sunny wall, protect from frost with light spruce or furze branches at night or by day in hard and cold wet weather, but letting the winter and early spring sun get to the beds.

Radish.—Early radishes may be procured by sowing in favourable February weather on a well-

prepared bed of light loamy soil on a warm border or in a sunny corner of the garden, with an old light or two or a collection of straw-covered hurdles to afford protection on cold nights, or they may be grown in cool frames by removing the cover during the day and replacing when frost is about. The soil should be rich and friable, and nicely drained, and the seed may be sown thinly and broadcast, giving tepid moisture with a rose in dry weather, and keeping the birds scared away. Quick growth is the thing to strive for.

Rampion.—The white, fleshy tap-roots of this biennial are boiled and eaten like asparagus, or used raw—as also are the leaves—in saladings. Sowings in the shade in good soil in drills 6 inches apart should be made in May for winter supply, or in March for late summer and autumn use, thinning out to 6 inches apart. Weed well. Rampion roots may be stored in sand in November, and will keep a long time.

Rhubarb.—Rhubarb may be planted in spring or autumn in well-dug and richly manured ground, placing the divided crowns 3 to 4 feet apart. Tubs or wide chimney pots can be placed round the sets in autumn to give an extra early supply of long, juicy stalks, and the ground should be well mulched with short decayed manure after pulling.

Rue.—Besides being a medicinal plant, Rue is useful for garnishing, and may be grown from seed sown in April, or propagated from slips.

Sage.—Sage should be grown in light, rich soil, and is propagated without difficulty by slips taken after flowering in the autumn, or by layering in spring. Harvest and dry in the air in September, preserving in light paper bags for pulverisation of the leaves in seasoning preparations in the kitchen.

Salsafy.—Salsafy, sometimes called the "Vegetable Oyster" because of the delicate flavour of the root when properly cooked, is a biennial. It should be sown in light, rich soil, well manured from a previous crop, in April, the plants being thinned out to about a foot apart.

Savoy.—The Savoy is a kind of cabbage with blistered leaves, very hardy and improved as to flavour by exposure to frost. Successional crops may be sown in February, mid-March, and late April, for later transplantation. Savoy requires well enriched ground to grow in, and plenty of room, from 15 inches to 2 feet of space per plant, according to the size of the sort. Tours is an early and excellent variety, Golden very handsome, and the Drumhead extra large but coarser in flavour and best suited for field culture and cattle feeding.

Scorzonera.—Scorzonera requires similar culture to Salsify, which it resembles as to root save for the back skin. To get the roots of Scorzonera large it may be permitted to grow on to the third year, and in cutting the leaves away for storing care should be exercised not to injure the root crown.

Sea-Kale.—Sea-Kale may be raised from seed, or cuttings of the root extremities or "r thoms." The seed should be sown about the beginning of April in drills 3 or 4 feet apart, and 3 inches deep. Thin out to 3 inches apart, and transplant later, say in July, into nursery beds, which should be of light soil. Throughout the late summer and autumn these must be watered and weeded. The following March carefully transplant all into well-prepared beds of deeply-dug and manured soil, 4 or 5 feet apart, and 3 inches deep. In the yard apart, place kale pots subsequently over each clump to protect the assemblage of crowns, covering all with 3 feet of fermented manure. The blanched stalks should be cut for use when ripe, going down to the roots, and the crowns may be used in the same manner as rhubarb and sorrel, or in the following manner:— Boiling and salting to preserve for the earth's worms piling.

Shallots.—Shallots are Syrian bulbs, excellent for pickling or for flavouring purposes, and may be planted in autumn or spring in good light soil, a warm situation being requisite for the first two settings. The after-treatment is analogous with that of the Potato Onion, and differing but little from what is necessary in the culture of ordinary small onions.

Skirret.—An oriental fleshy-rooted perennial, the roots of which are used for boiling and serving like

Salsafy. May be raised from seed, the seedlings being transplanted into a good depth of much enriched soil, allowing a foot to each plant, and watering well in hot weather.

Sorrel.—The leaves of this plant are employed in flavouring soups and in salads and sauce preparations. It will grow readily in any ordinary soil, and is propagated by division, planting in rows in early spring. The leaves are gathered singly for use, and are peculiarly acid to the taste.

Spinach. Spinach needs rich yet light land to grow in to perfection, and a plenitude of moisture. The seed should be sown in drills a foot apart in mid-March, and when the plants can be safely handled they must be thinned out to 4 inches apart. A good place to grow them in is between pea rows. The Round-leaved is a very good summer sort, and the Prickly-seeded spinach will stand the winter if sown in August, where it will come in for winter and early spring use. The leaves should be plucked singly as they grow. The full size, Spinach Diet, or Perpetual Spinach may be grown similarly to spinach. The Lettuce-leaved Spinach furnishes an abundance of succulent foliage for winter cutting, but requires slight protection against frost in hard weather.

Tansy.—Used occasionally for garnishing. Its plumose foliage exhales a very powerful odour. Used to be employed for imparting a peculiar flavour to certain puddings. It will grow in any odd corner.

Tarragon.—Propagated by root division in March and October, and should be grown in a dry and warm spot, in good rich soil. Cut down for kitchen use as winter approaches.

Thyme.—May be raised from April sown seed in good light soil, or increased by root division in spring, planting about 4 inches apart. Lemon thyme is much esteemed for its delicate perfume and delicious flavour.

Tomato.—The Love Apple, a South American fruiting annual, which has now assumed a highly important position as an article of dietary and commerce. Can be grown from seed sown in heat from January to March. The young plants must be pricked off into boxes of rich sandy loam and leaf soil as soon as the seedlings are up. When the second or third leaf appears, into well-drained 4-inch pots, and kept well up to the glass in a cool frame. Two further shifts will be requisite, to 6-inch and 12-inch pots respectively, if the plants are intended to be fruited in the pots, and in these stages of culture they should be gradually exposed more and more to air. They must be kept in a cool frame or cold pit, and when they are in flower, the pots being gently tapped to distribute the pollen for the purpose of fertilisation and assisting the fruit to set. The pots must be very well drained, and a stout stick be placed for training each plant, to in order that the fruits may not drag them down. They may be planted out in a sunny border in May at a distance of 2 feet apart, in which case they may be handled from 4-inch pots in May or early June.

Turnips. Turnips may be had early by sowing *Half Lion* White Forcing in a cool frame in February, or on a warm border in March, and this with judicious thinning, will quickly produce nice usable and delicately flavored roots. The heads must be carefully rubbed and brushed, but cleaned, and the turnips, if of any matter, so that well-rooted manure only should be employed in enrichment with as much charred vegetable rubbish and wood ashes as can be worked in, and after the sowing, a dressing of guano over the seed bed, and a covering of straw, or of manure, if the seed must be covered but very lightly, with fine soil, in shallow drills a foot apart. Thin the plants early to 6 inches asunder, and pull every alternate turnip for early use, leaving the rest to mature. Hoe frequently and water the young turnips occasionally, and if the plants are small, water them more liberally. If possible, and should the turnip flea appear on the beds, dust with lime after rain or when the dew is on the leaves, or a dressing of soot will do good. Early *White Strapleaf* is a very useful turnip, so is the *Purple Top* for forcing, and the *Swedish* for the cellar. *Yellow* and *Yellow Finland* fine for winter use. The *Jersey Navet* is an oblong variety which yields well to

does the Garden Swede. It should be mentioned if it turnip seed be immersed in soft water for a day before sowing germination is expedited.

Waxen-wort.—An indigenous perennial, which will grow anywhere, but is most pungently aromatic when produced on poor dry soil.

FRUIT GROWING.

Apple.—Generally speaking, apple trees require a good loam soil, with a subsoil of clay, though many kinds will grow and fruit well on a calcareous or gravelly subsoil. They should not, as a rule, be planted in low-lying ground or a moist situation, nor yet in a high and exposed position. A good maxim is to select the sorts of apple which do best in any locality for planting thereabout, having regard to the positions available; and counsel from a practical grower with a knowledge of the neighbourhood should be obtained by the novice, not only as to apple trees, but with regard to every description of fruit tree, bush, or plant of any kind, the cultivation of which is contemplated. Those whose available orchard space is limited will do well to go in for apples grafted upon the Paradise or dwarfing stock, which should not be planted nearer than 12 feet apart, while standards of the Free, or Crab stock, must not be placed closer together than double this distance. When the trees are received for planting, any time between November and March, care should be taken that they are not exposed to frost. The ground having been properly prepared according to its condition and the special need of the subject, a hole should be dug sufficiently deep and wide to receive all the roots without any cramping. Do not set too far down, though the soil may be loosed below the bottom root layer; it is better to lay out the roots too near the surface than too deeply. Be guided by the earth mark on the stem indicating how the young tree stood in the nursery. If the land be poor, work in with the planting soil some well-rotted manure. First trim off with a sharp knife all jagged root ends. Stand the tree upright in the hole, spreading out the bottom roots in an even radiation from the stem upon a nice even surface of mould, pressing or treading down firmly. Then put in more soil, holding up to the stem the next range of roots and filling in earth until they will lie horizontally. Extend and press these into position horizontally, and so on until the surface is reached, treading all well down, but avoiding caking.

Apricot.—Apricots flourish in good sound loam, with a chalky admixture, and may be planted in yard-deep holes in a sun-warmed and sheltered position, with a broken brick layer for drainage. Rotten leaves, to the extent of a quarter to three-quarters of the loaming staple, should be mixed well with the planting soil. Stop all leading shoots in pruning, and pinch back such as are not required to properly furnish the wall. Thin thickly-set fruit off partially at once, reserving a final thinning until the fruit has stoned. Protection against severe frost will prevent damage. Hemskirk, Moor Park, Orange, and Breda are recommended for outdoor fruiting.

Blackberry.—Stony banks and other waste places may be profitably utilised for the cultivation of the Blackberry, which will absorb heavy manurial dressings. Root cuttings of the wild British variety can be readily introduced, or a selection should be made from the numerous improved sorts stocked by nursery growers, accepting the advice of the specialist as to the variety best suited to the situation.

Cherry.—Every garden or orchard in which space is available should afford room for a cherry tree or two. A deep rich loam, well drained, over a dry subsoil, suits most sorts admirably. Those grown on walls should have a southerly aspect, and careful training is essential, while for orchards the standard form is best. Cherry trees, especially bush trees, should be autumn pruned, as this goes a long way to prevent objectionable gumming. Elton Heart is a capital white-hearted cherry, while the Biggareens fruit well a little later;

Yam.—The Chinese Yam, a fleshy-rooted perennial climber, throwing up annual stems, possesses thick club-shaped, starchy fleshy roots, not unlike those of the potato in taste after cooking. Pieces of the root may be planted in sandy soil, moderately manured in April.

The old Black Heart and Cluster are satisfactory dark orchard sorts, and for walls Black Eagle and the Morellos answer well, the Kentish variety of the latter being able to accommodate itself to almost any situation.

Currants.—Currants, as bushes, or trained on walls, will grow in any garden, but thrive best in deep, moist, rich soil, and are readily propagated from cuttings of young growing shoots struck under a hand-glass in light sandy soil from October to March. These or young bushes should be planted out in the autumn the second year 5 feet to 2 yards apart. Prune in winter, leaving the leading shoots about 6 inches long, and shortening the bearing wood on the sides of the branches to form spurs an inch or two long. The black currant needs only the weaker branches taking away to leave the robust growth to stand clear. Cut off any shoots on which aphides obtain lodgment, burning them forthwith. Trench in manure, well rotted, autumnally, and remove all suckers from the red and white varieties, encouraging them in the black section. Also cut out old-wooded wood and the leafy growth in the centre of the bushes, aiming at getting them open, with even and regular branching, and umbrella shaped. Good general-use currants are: *Red*, *Lace-leaved*, *Red Dutch*, *Champagne*, *Cherry*; *Black*, *Black Grape*, *Naples*, *Ogden's Black*, *Carter's Black Champion*; *White*, *White Durr*, *Wilmot's Large White*, *White Blanche* (almost amber coloured). Figs need a south wall and a sheltered situation, with firm loam soil, and frequent waterings with liquid manure during the growing period. A chalky subsoil is congenial, and protection against frost is advisable which shows in the late shoots in the spring following from an attempt at ripening, which will occur in the summer should it prove hot and genial. These bearing shoots should be trained at full length to the wall, and cut back to one eye when fruiting is finished. Figs best suited for outdoor culture in this country are *Brown Twikey*, *White Marselles*, and *Brunswick*.

Filberts and Cob Nuts.—Filbert and Cob Nut trees or shrubs make a very good screen in a large garden, and are ornamental in addition to being utilitarian. They will thrive in any ordinary soil which has been well manured, and should be planted in autumn, and pruned in April, which much improves them. Also planted rather closely in a sunny situation, they form capital hedges. The Kentish Cobs and the Red and White Filberts are all free growers. The pendulous catkins which show in early spring so prettily are the male flowers, and should not be shorn away too ruthlessly in pruning, or there will be few nuts on the trees later.

Gooseberry.—Gooseberry bushes like loose rich soil, absorbing but not retaining much moisture. They are propagated by cuttings, and should be planted in early autumn 7 or 8 feet apart, and pruned in January. The ground round the bushes ought to be forked lightly once a year, care being taken not to disturb the roots, and a little liquid manure is beneficial, also a superficial dressing of old horbed stuff. Let the main stem of young gooseberry trees run to a foot high before allowing lateral branches to extend, then prune as you would a red currant bush. If the caterpillar puts in an appearance, hand pick and destroy the pests. Good varieties are: *Red*, *London* (very large and smooth); *Turkey Red* (smooth, late, small, and prolific); *Red Champagne* (hairy). *Monarch* (rich colour, large and hairy). *Yellow*, *High Sheriff* (large and very hairy). *Yellow Champagne* (small, fine-flavoured, late, hairy). *Gipsy Queen* (smooth, large,

hairy, pale-coloured). *Early Sulphur* (smooth, bright and abundant). *White*, Whitewith (downy, splendid flavour, large, hairy, bearded). *Greenish* (creamy white, smooth, large). *White Chagne* (small, sweet, hairy). *Snowdrop* (hairy and prolific). *White Fig* (small, smooth, and will hang till it shrivels). *Greens*, *Green Gascolne* (small, early, and deep coloured). *Shiner* (very large, round, smooth). *Thunder* (hairy, rich-flavoured, large, early). *Heart of Oak* (smooth, oblong, large, yellow-veined).

Grapes, Outdoor.—If suitable vines be planted, in a properly-constructed border, against a high warm house or other wall with a southern aspect, ripe grapes may be secured by careful cultivation out of doors in favourable seasons in this country, and a well-trimmed vine is always very ornamental. The best sorts for this treatment are *Royal Muscadine* (white), the old *White Sweetwater*, *Miller's Burgundy* (purple), *Black Cluster*, and *Chasselas Vibert* (white and sweet). The border may be made on the ground itself, if with an asphaltic or concrete foundation all the better, but the bottom must slope gently down to a drain. Chalk, well rammed, say 4 inches deep, makes a good first layer. Upon this place a thickness of a foot of rubble, rough and free from dust and dirt, with an admixture of large broken bones, calcined or not, but clean. Next a layer of turves, grass-side downwards, and on the top of this, a depth of not less than 3 feet (3 feet will be better) of compost. This should be formed of five parts rich fibrous loam, one part of half-inch bones, and one part old mortar and broken-up bricks, with wood ashes, charcoal, and burnt clay or ballast. All is to be thoroughly mixed and placed on the border dry, being kept in position preferably by an outer wall of firmly-piled reversed turves, dressed smoothly on the front, so as to have the appearance of a shapely bank with a slight slope from the ground level inwards to the upper surface of the border, which should be as wide as possible. When all is nicely settled by a few preliminary waterings, the vines may be planted out in spring time, when the young shoots are started, spring being a good season for the operation, though October will serve. Plant with the stem from 1 to 2 feet away from the wall, spreading the roots carefully about a foot down, to reach to a half-circle outwards. Press the soil firmly upon these, leaving a little depression at the top to facilitate waterings afterwards, which should always when necessary be so administered as not to disturb the border structure. Before planting, each young vine for which there is wall space should have been pruned to have on the one main stem three branches or collars, from each of which in turn a shoot springs. These, by systematic pruning, are worked in successive long rod lengths, one to run horizontally as far as it will on the wall space available, the second half the length, and the third to be pruned and held back for the production of the renewal shoot. The pruning of the rod which has done fruiting duty in the preceding season and the training in of the shoot to succeed it, ought to be accomplished during late February in open weather, before the sap begins to rise. All the young shoots should be neatly nailed to the wall without bruising, in mid-May, when they have attained a length of 3 or 4 feet, pinching off the ends 6 inches beyond the last young bunch. At midsummer the branches may advantageously be gone over again, and all fruitless growth not required for the next season's wood cut away. At any late time should there be too vigorous foliage further judicious stopping and pruning must have attention. The bunches may have the berries thinned out very carefully with grape scissors when this appears desirable, to allow space for their individual expansion. Water in very dry weather, and should the vine-mildew appear on the leaves, like a fine white powder, sulphur dusting must at once be resorted to. (See also *Vine*, *Vadour*.)

Japanese Wineberry. (See *Wineberry*.)
Logan Berry.—A cross between the Blackberry and the raspberry, very pretty for training over wire arches or trellises, and a free grower. The fruit, resembling that of the raspberry, is useful for culinary purposes, and the correct cultivation is similar to that requisite for the raspberry, save as to the training of the long rambling shoots.

Medlar.—A deciduous tree, bearing hard green fruit unfit for eating until "bletted" by keeping two or three weeks after gathering in November, when it is agreeably acid and slightly astringent. Does well in a loamy and moderately moist ground. May be propagated by budding on the quince or whitethorn, and requires rather free pruning. There are several distinct sorts of medlar, the Dutch and the Stoneless being most frequently met with.

Melons.—Melons may be grown readily in hotbeds and frames, made up as for cucumbers. They require a good deep bed of very firm loamy soil over a fermenting manure. Never more than three fruit should be permitted to form on one plant, as all appear at about the same time, and three is enough—select the most promising and central—to tax the nutrition-providing powers of each subject. Let these swell coincidentally, nipping off every superfluous shoot. It will be necessary to keep the air dry in the frame whilst fertilisation of the female flowers is being secured, and this can be accomplished by slightly opening the lights at the back at night. When the fruit is well set and swelling, slip a slate under it, and keep up the heat and moisture in the frame liberally until the first sign of ripening appears, after which aim at securing dryness again. As soon as the stalk looks like separating from the fruit, it is ripe; it should then be cut at once and eaten as soon as possible, or the flavour will deteriorate. A second crop may be induced by allowing new shoots to start from the centre and cutting all away beyond them, remoulding up the bed with fresh soil and giving liquid manure to get the new growth going, and then proceeding as before, save that this time only two melons should be fruited to each root. From setting to ripening occupies about five weeks. Mildew can be kept down by sulphur dusting and cautious increase of air, and it may be necessary to fumigate to disestablish red spider. Fresh-slaked lime round the neck of the plant is often useful in the prevention of damping off. Good seed of scarlet, green, and white fleshed varieties of melons may be had of all nursermen of repute, and should be raised as cucumber seed is.

Mulberry.—A tree of Persian origination and ornamental appearance, bearing richly aromatic and juicy oblong fruit in some favour for dessert. Likes a deep loam, and plenty of moisture and a sunny position; either as a standard or trained to a wall. Propagated from cuttings or by layering the young branches. The fruit of the Black Mulberry is the only kind eaten in Britain; the White Mulberry is utilised in China for silkworm feeding.

Nectarine.—A smooth-skinned variety of the Peach, which see.

Nuts. (See *Filberts*.)

Orange.—Ordinarily when the orange is cultivated in this country it is rather because of the ornamental habit of the plant and the beauty and odoriferousness of its blossom than on account of the fruit, which rarely reaches perfection, with even an expensively appointed and spacious orangery. But with some considerable trouble oranges may be fruited very well in a British hothouse, and some of the handsome Tangerine sorts thoroughly ripened. This is a matter for the possessor of a hothouse, though, who is scarcely expected to seek cultural counsel in these pages. He who was not at command a roomy glass structure to such the temperature is never below fifty on the coldest winter night is wiser off from any attempt at orange-growing. He will never produce fully developed fruit, though, with luck, he may maintain small orange trees in sufficient health to get them into blowing and bearing, and be able to use them for ornamenting a conservatory or a parlour.

Peach.—Peaches and nectarines are nearly related, the former having its delicious fruit downy-skinned, the latter smooth. Both are usually grown grafted upon the plum or almond stock, and trained to walls or wooden trellises when cultivated out of doors, the branches being tacked or nailed to the support until the leaves fall, when they are released to facilitate pruning. Wispes of straw are bound round the ends of the severed branches for protection during the winter, re-nailing and supporting being performed in spring to

assist new growth. When the leaves fall in autumn they should be swept up and burnt, as they generally harbour the germs of various insect life. Peaches and nectarines flourish best in calcareous loam, of good depth, resting upon a gravelly or well-drained subsoil. Four year old trees are those usually sent out by the nurserymen; and the approved pruning method is to cut back the young shoots to two-thirds of the wood grown in the previous year. Bearing only results from wood of the current season. Fruit set too thickly should be thinned when the flowers fall, and again when the leaves have been permitted to remain so far reaches marble size. Rivers's Early York, a large and handsome peach, of splendid flavour, is one of the best varieties for garden growth, while among nectarines Early Rivers's bears fine fruit which ripens out of doors during auspicious weather before the end of July.

Pears.—In selecting young pear trees for planting—whether they be on the free (or wild pear) stock or upon that of the quince—many people like to have them one year from the graft, others those of two or three years' training. Wall pears require branch pruning and training in winter, and the rubbing off of superfluous shoots during summer. Marie Louise and Beurre Hardy are grand wall sorts, while for standard, pyramidal, or bush growth, Pitmaston Duchess, Targonelle, Williams's Bon Chretien, Doyenne du Comice, and Louise Bonne de Jersey are all choice fruiters. The Black Worcester is a fine culinary pear.

Plum.—Plums succeed best on loamy soil, with gravel or light clay at a good depth below; but there must be good drainage. They are grown bush form, as standards or half-standards, and as wall trees. They are supplied by the raisers on numerous stocks, and after planting, on the principle explained in dealing with apples, plum trees do not require much pruning, as over-free use of the knife sets their resinous, juicy "bleeding." Root-pruning is useful to check rank growth in the plum orchard, and young shoots forming too freely on bush and wall plants should be promptly pinched off, to let in the light and air to the wood which will be productive, and root suckers should be removed assiduously every autumn, or they will quickly prove exhaustive to trees and land alike. It is advisable to afford support to pendulous branches when laden with fruit, as plum wood is peculiarly brittle. Very good plums to grow are:—Early Orleans (a fine wall sort), Victoria (dessert or cooking), Golden Gage (dessert), Washington (hardy Gage), Monarch (dessert), Pond's Seedling (culinary), and Wyndale (very late cooking). Mirabelle, or cherry plums, bloom very early, and require shelter and a warm aspect. They are long stalked, red and yellow in colour. White Magnum Bonum is a choice plum, and so is Rivers's and Early Apricot. Of the damsons, Kentish Cluster, Prune, and Blue Prolific are recommended.

Quince.—Largely employed as a dwarfing stock for certain kinds of pears, but sometimes cultivated for its powerfully odoriferous and astringent fruit, which makes good marmalade. May be propagated from cuttings, and treated as an orchard-tree. The Portugal Quince produces the finest and largest fruit.

Raspberry.—Raspberry plantations are best started in the autumn, and, properly attended to thereafter, they will continue to bear abundantly for years. The ground should be prepared by deep digging, and heavy manuring. Many growers prefer row-planting, allowing about a yard between the rows. Plant firmly, obtaining strong canes, with a plentitude of fibrous roots, and shorten to a uniform height. The weaker suckers should be excised in June, leaving about half a dozen canes to each plant. The ground round the plants or bushes should not be disturbed with the fork after they are once established, but a good dressing of rotten manure may be given annually. Autumn-bearing Raspberries should be kept rather thin. October Yellow is a very fine late sort; Glenfield is quite black; the Red and Yellow Antwerp, White Magnum Bonum and Carter's Prolific are all held in high esteem, and Superlative is worthy of its name, as it is certainly one of the very best.

Strawberry.—Strawberries must be cultivated in a deeply-dug and highly enriched porous soil, sufficiently drained. Dark yellow loam, not at all sticky, and thoroughly worked well before planting time in August, will give a good result. Plant the rooted runners from the nursery bed in rows 3 feet apart, allowing a foot between each plant. Bring them in the trowel singly, with a good ball, disturbing as little as possible in the operation, press down and round firmly, and water occasionally until new growth is evident. In the spring a good top-dressing of loam is helpful, and a few days later a mulching of long litter worked under the leaves will conserve moisture and keep the fruit clean when it comes to develop. Strawberry plants should never be permitted to get at all dry at the roots, and plantations must be renewed not less seldom than every third year. The old leaves may be advantageously cut away after fruit gathering, a mulching of short well-rotted manure being applied at the same time. Only a sufficiency of runners must be allowed to start off from the rows to serve for new plant material, and the secondary runners of these should be chopped away and destroyed. It is bad policy to replant the layered runners, after their individual development elsewhere, in the parent-bed when renewal time comes. Then a thorough re-trenching and re-making of the beds should take place, importing plants from a distance, placing out your own raised runners in quite a fresh situation. Change of ground is good for strawberries. Royal Sovereign, Sir Joseph Paxton, Vicountesse Hericart de Thury, and British Queen, are amongst the best early fruiting sorts; while for successional yield Frogmore Late Pine, Waterloo, Lord Suffield, and Wonderfil, are all admirable.

Vines (Indoor).—To grow grapes thoroughly well and with certainty in this country it is necessary to have a suitable glass structure, and provision for keeping under a proper temperature therein, either by an efficient system of hot water apparatus or by well-constructed flue, circulating warmed air through the house, such air being heated at an outside furnace of proper dimensions and receiving regular attention. Theinery may be small or capacious, according to its owner's means or desiring, but it should be well built, well placed, and well looked after. The border from which the vine or vines receive nutriment ought to be partly internal and partly external, and its arrangement internally should form a supplementation of what has been advised for outdoor grape culture, continuing well over the floor of the structure, and in communication with the outside border made as directed. Planting of the vines may proceed internally as was indicated to be good practice outside, sufficiently large apertures in the brickwork supporting the frame of the house having been left purposely for the roots to run through. Training of branching shoots of the indoor vines will be up the sides and beneath the glazed top of the house, instead of upon an external wall, the most important difference being that short rod or spur pruning will be permissible alternatives in after treatment. Indoor vine borders will require frequent watering with tepid water, and forcing must, when necessary, be managed with circumspection, fire heat being supplied gently at first, and gradually wrought up to the requisite maximum, as much ventilation being afforded as a general rule as the weather will permit.

Walnut.—The walnut tree luxuriates in a deep sandy or calcareous loam, freely exposed to light and air. It is usually raised from seed, and is improved by cutting off straggling growth in autumn, saying—"a woman, a dog, and a walnut tree, the more you thrash them, the better they be"—is most misleading. It is essential that as little injury as possible should be inflicted when walnuts are gathered, fruit being borne at the extremities of the preceding season's shoots. Highflyer is accounted the best of the cultivated varieties.

Winberry (Japanese).—Liking a sunny spot, this delicious fruit, of intermediate flavour between that of the blackberry and the raspberry, is borne in August on the suckers of the previous season's growth.

INTRODUCTION.

In a previous edition of this CYCLOPÆDIA we spoke of the increased attention that was being given to the subject of poultry-keeping by British farmers and cottagers. That increase has been well maintained. Wonderful, indeed, has been the advance made in the breeding of high-class pure breeds of poultry, and astonishing have been the achievements of poultry-fanciers in the perfecting of the show points, not only of the old and strongly established breeds, but also of new ones as well. Some writers decry the poultry-fancier. The poultry-fancier is the man who has done more than any other to raise the status of poultry-keeping in the British Isles. If it were not for the poultry-fancier, whose one aim is to keep perfection and purity of breed to the front, the poultry of the country would soon degenerate into a worthless lot of mongrels. It is only by keeping our breeds pure that advance can be made in the utilitarian properties of egg-production and poultry meat. Another benefit which the poultry-fancier confers on his country comes through the educational value of poultry shows, which, generally speaking, are run entirely by poultry-fanciers. A man may read about the millions of pounds which we send out of the country each year for table poultry and eggs, and in the usual fireside manner will shrug his shoulders and think what fools British breeders are not to produce more eggs and poultry themselves. That is about the extent to which you will rouse the average Britisher in cold print; but take him to a poultry show, interest him in the beautiful colouring and feathering of the Plymouth Rocks, the Wyandottes, the Leghorns, and Minorcas, and his fireside interest departs. In its place comes a vigorous, wholesome enthusiasm. He asks questions as to egg-laying qualities of the different breeds, the fineness of their flesh, their adaptability to confinement. He then goes on to wonder if in his little suburban garden it would be possible for him to put up a house and run suitable for half-a-dozen, or maybe a dozen, hens, just to supply himself and family with the maternal "new-laid eggs for breakfast." For the largely increased interest in poultry-breeding, thanks are due, as we have said, to the numerous poultry shows which are held in different parts of the country, and to the other numerous educational agencies which have been at work during recent years.

The most revolutionary incident in connection with poultry-keeping has been the introduction in recent years of what is known as "The Intensive System of Poultry-Keeping." By the adoption of this system it is possible for any town-dweller who has a small yard behind his dwelling-house to indulge in the hitherto altogether impossible pleasure of poultry-keeping. This system, as yet, is quite in its infancy, but it is being taken up with the greatest enthusiasm, not only by townsmen, but also by country people too. In fact, one gentleman has 3,000 hens being kept under the Intensive System. Briefly, we may say that this system is the keeping of large numbers of fowls in very confined space, with no out-door run, but with an upper and lower chamber to the poultry-house. Special feeding is resorted to, but the great secret of success, so far as the Intensive System is concerned, is the admission of plenty of fresh air into the house, the constant attention to cleanliness, and the keeping of the hens always on the scratch. We have not space here to go more fully into details, but those wishful to pursue the matter further may obtain at the small cost of sixpence a most excellent little booklet by Mr. W. Powell-Owen; its title is, "The Intensive System of Poultry-Keeping," and in its pages are given illustrations of intensive house, boxes for growing green food by the process known as sprouting oats, chicken-rearing flats, and the other chief appliances. The Intensive system is quite a new thing,

it is therefore too early to speak of results, but one is bound to confess that it gives evidence of completely revolutionising poultry-keeping in this country.

We hear from time to time some sad stories of the experiences of those who have sought to supplement their incomes, or to obtain their whole livelihood by poultry-keeping. But from these we must not draw the moral that poultry-keeping will not pay. Poultry-keeping is a business, and, like any other business, it needs to be conducted upon businesslike lines. Any misdirected business comes to a smash, whether it be the breeding of poultry or the working of a diamond mine. Those who desire to indulge in poultry-keeping should first of all learn the rudiments of the art on a small scale before they launch out into wider fields. In other words, no one should enter into poultry-keeping on a large scale until he has first of all tried his "practise hand" on a few birds. Practical knowledge and experience may be gained from a small stud, and once the elementary principles have been mastered, the student can then enlarge his borders; but the novice who would be successful should commence in a small way, and then go on to higher things. At first there will not be much profit, but as experience is gained so the profits will increase. If proper care and attention are given to the work there will be no loss either in the early stages or in the later and more extended form. Failures in ninety-nine cases out of every hundred are traceable to the adoption of wrong methods or to neglect.

With these preliminary remarks we may now proceed to set forth in dictionary form the various things which it is useful for the poultry-keeper to know. Our information is gathered from recent practical experience, and should enable those who study it to follow the pursuit with a reasonable chance of success. It is best not to expect too much to begin with, otherwise disappointment may follow.

In the following sections the various breeds of poultry, including the bantam varieties, are first enumerated, and their points, peculiarities, and economic value briefly noted; following which comes a mass of closely-digested matter, as to poultry-rearing and treatment and the appliances requisite to success in the keeping of fowls.

Ducks, both utilitarian and ornamental, are then dealt with similarly, and, in order thereafter, attention is given in a like manner to geese, swans, turkeys, guinea- and pea-fowls. To make this Dictionary as complete a Bird-Fanciers' Guide as is consistent with conciseness, pigeons are briefly noticed before passing to the consideration of the avian pets of the household.

The Cage Bird section at the close will be found to comprise practical details concerning the different kinds of domestic favourites, foreign as well as British, and their management in health and ailment; with notes on the breeding and rearing of canaries, and all the rest of the birds usually met with in confinement, on the stocking of aviaries, and the selection of cages, besides much other helpful information proper to the subject.

BREEDS OF POULTRY:

Their Points, Peculiarities, and Value.

Akbions are the result of a cross between two Sussex breeds; are of white plumage, and make good table birds. In recent years they have been given the name of white Orpingtons, and are to-day one of the most popular breeds known. They are good layers of large brown eggs.

Anconas are small, active fowls and non-sitters. They are probably the result of a cross between Black and White Minorcas, and the first specimens were brought from Ancona to Britain about 1884. They are of mottled black and white plumage and yellow legs with black spots; single combs; good layers of white eggs in summer, but not remarkable for table qualities.

Andalusians are a beautiful Spanish variety of slate-blue brown colour, with very beautiful dark edging or lacing to the feathers, and much resemble Minorcas in form. They are good layers of white eggs; but are faulty breeders, not more than half the chickens hatched being of the true markings, even when the eggs are from prize birds.

Asseels are small, heavily-built birds of the best Indian Game type, and they are very pugnacious. They are only moderate layers, being chiefly kept for show purposes.

Bakie, a local name for the Dumpy breed so popular in parts of Scotland.

Bantams are kept more for pleasure than profit as a rule, but there are many beautiful varieties, both in the game and other sections. They are the result of carefully selected small "sports" of the larger varieties, fresh in reality, encouraged into perpetuation by fanciers, especially in Japan. Thus we have Black Rose-comb Bantams, the Black Hamburg in dimin-

utive; and the Game varieties are also dwarfs of their fully-sized progenitors; the Old English Game Bantam is one of the most popular of these dwarfs; White Rose-combs, hooted (mainly white, though blacks have been shown), Plymouth Rock, Scotch Grey, Silver-spangled Hamburg, Partridge and Silver-pencilled Wyandottes, Brahmas, Leghorns, Minorcas, Anconas, Andalusians, Japanese, Nankin, Frizzles, Cochins, formerly known as Pekins, and Sebright Bantams, the latter with their pretty lacing on the beautiful gold and silver ground colours. All have their admirers and exhibitors.

Bolton Greys, a Lancashire local name for a variety of the Silver-pencilled Hamburg.

Brassals are a Belgian breed; practically the same as Campines, but generally rather larger in body, and coarser in its markings. Not a good table bird, but a prolific layer.

Brahmas are a fine Indian breed which attain a good size, but have fallen off considerably in recent years in point of quality. They are large, of erect bearing, and heavily feathered. There are two varieties, light and dark, the light variety being the best. The eggs are large and brown. They consume much food, and are frequent sitters.

Bredas are a French breed of fowl, sometimes styled Guelldres, not much favoured in Britain, slightly crested, large wattled, and resembling the Polish variety in general characteristics.

Brown Leghorns. (See Leghorns.)

Brown Game. (See Game.)

Buttercups, Sicilian. (See Sicilian Buttercups.)

Campeans are a Belgian breed, small, active, non-sitters; they have barred plumage, single combs, and slate-blue legs; are good layers, and useful when young for table purposes. There are two varieties—Silver and Gold, the former being most in favour.

Chittagong, an Indian fowl, large in size, of the Brahma class.

Chittiprat, a Yorkshire local alternative name for the silver-pencilled Hamburg.

Cochins. These are well-known members of the fancy variety come from China; large, bulky, of low carriage, pronounced cushion, and heavily feathered. There are five varieties—buff, partridge, cuckoo, white, and black. Buff Cochins are the most popular. They are neither good table birds nor good layers, but produce a fair number of eggs in winter, and of large size. They are good eaters, and are mostly kept for show.

Columbian, a black fowl, a cross between the Malay and Spanish, very hardy, glossy plumaged, and a layer of enormous eggs, now rarely heard of.

Coucou de Mailles are a Belgian variety of not much value except for the table.

Courtes-Pattes, a short-legged, bearded French breed; good all-round fowl, but seldom seen in England.

Crecals, or **Creolans**, a name sometimes given in America to the Silver-pencilled or Silver-spangled Hamburg.

Creve-Coeurs are a black-plumaged French breed, very popular in its own country, but not over well suited to our climate. They have a two-horned comb and large crest. Good layers and table fowls.

Danvers White, an American breed formed by crossing White Dorkings with Buff Cochins; a good fowl for laying and hardiness, but superseded by the White Leghorn.

Dominiques, one of the oldest American breeds, cuckoo marked, rose-combed, four-toed, yellow-legged, hardy, excellent layers, good table-birds.

Dorkings are the oldest English breed; square-bodied and deep-breasted; most valuable for table purposes, but not very good layers. Much used for crossing with game to produce table-birds. There are four generally recognised varieties—dark, silver-grey, white, and cuckoo—and several other little-known types, such as the red. The usual weight of a cock is from 7 to 11 pounds, and the flesh of these birds is of excellent quality. The eggs average over two ounces.

Duckwing, a class of game fowl, in two distinct varieties, yellow or golden, and silver-hackled; both are beautiful, and possess all the good table-points of the game breed generally. There are also Duckwing Leghorns.

Du Mans are a black, rose-combed, French breed, almost entirely bred for utility.

Dumplings are sometimes called *Go-laighs* or *Bakles*, and are much in favour in Scotland; they have large square bodies and very short legs; the colouring varies. Both good layers and table birds.

Faverolles are a modern French variety at present in great favour. There are two varieties—salmon and ermine, the former being most generally met with in this country. It is a first-class table breed. Its great claim to recognition is the early maturity of the chicken.

Friszles come from Eastern Asia, and are remarkable for the peculiar backward curl of their feathers. Their plumage is commonly white, but there are also brown and black specimens. They are only moderate layers.

Game Fowls are usually poor layers, but capital sitters, and the hen make good mothers. Splendid table birds, their chief objection is their incorrigible pugnacity, which hardly seems to have abated since the cruel old cock-fighting times. The old English game fowls are largely used for crossing with other breeds, and the Game-Dorking hybrid is about the best early-developing table-bird we have. The leading varieties of Old-English Game Fowl are the black-red, brown-red, pie, duckwing, black, white, henry, birchen-yellow, and ginger-red. The modern Game Fowl is of little use, except from an exhibition standpoint.

Gondook, a handsome variety of the Rumpless fowl, black and upright, very lively and iridescent of plumage, very rarely met with.

Hamburghs. There are five principal varieties—black, silver, and gold pencilled, and silver and gold spangled. They have a large rose-comb with long and pointed spike, and large, round white lobes; the legs are a dark slate blue, except in the black, which should be darker, approaching black; they are non-sitters, and fairly popular for show purposes. They are more appreciated for their beauty and activity than for their other qualities, although they are good layers of white eggs. Cuckoo and White Hamburghs are both occasionally met with.

Hanny Game are a variety in which the cock-birds have straight tails and plumage like the females, and have been bred true for many years in Cumberland, Westmorland, Devonshire, and Cornwall. The hatched strain of Sebright Bantams is founded upon this peculiar variety of fowl.

Houdans are a popular and precocious French variety, with heavy crest and bib and curious leaf-shaped comb; plumage similar to the Ancona; a good layer of white eggs, and a very useful table-bird; makes a very good cross with Game or with Orpingtons; not very popular for show. The economic merits of this fowl are very great.

Indian Game, a huge-boned member of the Asiatic Game family; very heavy, fair layers of buff eggs, most useful for crossing with Dorkings, Orpingtons, and Faverolles to produce table-chickens. Good sitters and excellent nurses. Popular for show.

Japanese Bantams are pompous looking little white birds, with straight black tails, laced with white, and very short yellow legs. Some varieties have been exhibited in speckled and cuckoo colouring.

Japanese Long Tail. A bird somewhat like the old English game fowl, save in the peculiar respect of the tail of the male, which sometimes reaches a yard or more in length. They are somewhat delicate, and quite unfitted for an English utility poultry yard. (See *Yokohamas*.)

Javas are an American production; large, good layers of coloured eggs, and a nice table-fowl; three varieties: black, white, and mottled; little known in England, but worthy of attention.

Jersey Blues. American, Plymouth Rock shape, and Andalusian shaped plumage; not of much merit.

Jungle Fowl. The wild poultry of the Orient, supposed by many to be the originator of all the modern domesticated breeds.

Klondyke. An American mongrel production, with much Silkie blood; white; has been shown in England, but gained little or no favour.

La Bresse. A French breed of the highest table quality. Two varieties, grey and black; good layers, but rarely sit.

La Fleche. A black French breed, with two-horned comb, but no crest, famous as a table bird, remarkable for fineness of flesh, good layers, but seldom sit.

Lakenfelders are a comparatively recent importation of Dutch or German origin, with white body and black hackle and tail; very small, good layers of white eggs; enjoy fair popularity; but are very wild and rather delicate.

Lancashire Mooney. Local name for the Hamburg fowl.

Langshans. Originally came from a district in China on the Yangtze-Kiang, and have proved a very valuable breed. They have brilliant black plumage; are very good layers of rather small, dark-coloured eggs, and are of capital table quality; the original type had moderate length of limb and big body, but birds bred for show nowadays are much taller. A strong effort is now being made to popularise the original type.

Leghorns. A rather small, non-sitting, active, Italian breed; very good layers of large white eggs; heavy combs and large white lobes; several varieties—white, brown, buff, blue, black, pile, golden duckwing, silver duckwing, and cuckoo; most of these enjoy considerable popularity for show. As layers they are

generally unsurpassed and are hardy, useful birds, though not specially good for the table.

Le Mans. A small-crested, French fowl, of the *Crève Cœur*, or "split-heart" comb genus.

Lincolnshire Buffs are a local breed of poultry, large and fine-breasted, overshadowed of late years by the Orpington class, which possess the best table qualities of the older variety, besides being better layers as a rule.

Malays. A big-limbed variety of the Asiatic Game family, bred mainly for show purposes.

Manchester. Alternative name for the Rose-comb Blues.

Minorcas are one of the best breed of domestic poultry. Medium sized and of Spanish origin; large single combs and white lobes—very good layers of large white eggs; highly recommended for sheltered runs; very popular for show; white and black, non-sitters. Not of much use as table birds.

Modern Game. Very tall, evolved from the Old English Game, and bred solely for show; very popular, several varieties—black-red, brown-red, pile, duck-wing, birchen, white, black, etc. (See also **Game Fowls**.)

Mooney. A Lancashire name for the Hamburg; the Golden Mooney and Silver Mooney are the yellow and white varieties respectively.

Naked Necks. Curious variety of Transylvanian origin, with necks devoid of feathers; several colours.

Nankin Bantams. One of our oldest breeds, and seldom seen now; they are of a cinnamon hue in colour, and are believed to have been the foundation of many other varieties, especially Sebrights and Game.

Negro Fowl. The Silkie is sometimes so styled because of their very dark skins.

Old English Game. The original type of English fighting game; shapely and handsome; fine framed for table, and very valuable for crossing; still very popular for show; several varieties, black-red, brown-red, spangled blue, blue-red, birchen, brassy-back, black, Furness, tassled, crele, henny, etc., with variations in the females.

Orloffs. A Russian breed; large, very big heads, with beards and muffs, useful for general purposes.

Orpingtons. An English composite breed, and one of the most popular of the day, originated by Mr. William Cook, of Orpington. Lay well in winter, and are very valuable birds, of great size and cobby shape; very hardy, and good layers of brown eggs; capital table birds; highly recommended. Several varieties—black, buff, white, Jubilee (a tri-coloured variety), and spangled. There are both single and rose-combed Orpingtons, and the former are favourite exhibition birds.

Passebecken. A German breed, little known in England.

Pavlov. Russian, believed to be the original of the Polish breed; little known.

Pheasant. A Yorkshire local alternative name for the Hamburg breed of poultry.

Phoenix. A name given at times to a variety of the Japanese long-tailed fowl.

Plymouth Rocks. A splendid American composite variety; large, tall, handsome, rich orange-yellow legs, and moderate single comb; splendid layers of brown eggs summer and winter; mature early; are capital sitters and mothers; good table birds, but yellow skin; very popular for show. Four varieties—barred, white, buff, and black. The latter, thus far, have not been very popular, but are now being brought very prominently to the front, and are proving themselves most valuable as a general all-round fowl. A Rose-combed variety has in recent years made its appearance, but has not been popularly received.

Polish. A very handsome crested breed, of Continental origin; very popular in France and Holland; good layers and hardy if they can be kept from wet; non-sitters as a rule; chickens rather delicate; several varieties—white, silver, gold, white-crested black, buff-laced or chamois, blue-laced, etc.; has curious formation of skull.

Ramelslohers. German breed, useful for general purposes. Bred little in England.

Redcaps. An English breed of the Hamburg type, but with very heavy rose-comb, found in Derbyshire and Yorkshire; capital layers of large eggs, winter and summer; pullets soon begin to lay; plumage gold spangled with black.

Rhode Island Reds. American, large, long, deep bodies, rich chestnut-red colour; valuable all-round breed; yellow legs; rose and single combs.

Rosecomb Blues. An English type of laying fowls; very large. Good layers; met with in Lancashire.

Rumpless. Are a curious breed without rump and tail formation. They are of several colours; met with in several parts of the world, and may be attributed to a freak of Nature; occasionally exhibited. Not a very useful bird.

Scots Greys. A Scottish variety; barred plumage like a Plymouth Rock, but white legs spotted with black; good layers and table birds. A fine all-round fowl.

Sebright Bantams. Handsome little birds, the type of which was founded by the late Sir John Sebright, by first crossing between Polish and Nankin Bantams, to get the lacing of the former and the smallness of the latter, and then with a dwarf of the "henry" game species, to obtain the "henry" hackles and tail of that fowl. Thus the Sebright type was secured, and there are gold and silver sorts, both rose-combed.

Shawwoods. A large, white American breed not common in England, slightly feathered yellow legs, good layers and table birds; lay large brown eggs. Highly spoken of.

Silkies are supposed to come from Japan; very small, with white, silky plumage and curious mulberry combs and slightly feathered legs; popular for show, especially among ladies; most useful as sitters and mothers for Bantam chickens or pheasants. Skin very dark. Hardy, and lay cream-coloured eggs.

Silician Buttercups. An old Italian breed "Uccello di Joire" (flower bird), or "Longhi Sicilian," meaning Sicilian spout. Introduced into America about sixty years ago, but for the last twenty years seem to have disappeared. Interest in them was revived in 1911, and a club formed. English breeders became interested, and in 1913 birds were introduced into England. They are essentially utility birds, being exceptionally good layers. In shape they take after the other Italian breeds, such as Leghorns, Andalusians, Minorcas, and Anconas. In colour the cocks are somewhat similar to Rhode Island Reds, but not quite so dark. A rich bright red is what is required. The hens should be a rich deep golden buff, mottled with black. The legs should be willow-green. The name comes from the comb, which is altogether different from any other known breed of poultry. It is cup-shaped, with a row of spikes round the cup.

Silky Cochins, sometimes styled "Emu" fowls, are a rare variety, in which the webs of the feeters have no adhesion.

Spanish, similar to Minorcas, mostly black-plumaged, with large white hanging-facets; once very popular for show, but now only occasionally seen; good layers of large eggs. Like Minorcas again, there are white varieties of Spanish, but they are very uncommon.

Sultans.—Very beautiful small white breed from Turkey; large crests and bills, flowing tails, and heavily feathered legs and feet; not very popular, because of the difficulty of keeping them in good plumage. Good layers of large white eggs; small eaters and non-sitters.

Sumatra Game. A sprightly black variety of the Eastern Game family; capital layer of white eggs, now becoming popular in England.

Surrey Fowls, so famous for their fine table quality, are chiefly identifiable with the Dorking breed, or are crosses of that fine bird and some other variety. They are grown on rapidly as chickens, and then fattened for market by "cranning."

Sussex. A type of utility fowl largely bred in Sussex for producing table chickens. In recent years

have become very popular as show birds. Four varieties, red, speckled, light and brown.

Wyandottes. A splendid and comparatively new American composite breed; shape something like a Brahma, but do not carry so much body feather, and are clean legged; they have rose combs and yellow legs; many varieties—silver-laced, gold-laced, white partridge, buff silver-pencilled, buff-laced, blue-laced,

black, cuckoo, and Columbian. Splendid hardy winter layers; good table-fowl; has high economic merits; highly recommended and very popular both as utility and exhibition; are good setters and most careful mothers.

Yokohamas are fine long-tailed birds from Japan; rather rare; good layers. (See *Japanese Long-tails*.)

POULTRY MANAGEMENT IN HEALTH AND DISEASE.

Accommodation.—The numbers and character of the fowls kept should be suited to the accommodation, as to runs and housing, which can be provided for them. Overcrowding will lead inevitably to fouling of the ground, disease in the birds, and disastrous failure. (See *Houses, Runs, etc.*)

Ale is sometimes mixed in the meal, of which the soft food for fowls is formed, to give the birds extra brightness and spirit, but the practice is not one to be recommended, save as a restorative expedient, and then there are many things more suitable than beer for the purpose.

Appliances for poultry-keeping need never be elaborate, provided they are always practicable and utilitarian. Plain and home-made fittings for runs and fowl-houses nearly always answer as well, if contrived with ordinary ingenuity, from the materials convenient to hand, as costly appliances from the hardware manufacturers and poultry-appliance dealers whose multitudinous utensils and superfluities are on view at shows and stores. (See *Water Troughs, Winter Management, Coops, Incubating, etc.*)

Bantam Keeping, save for the sale of choice exhibition stock, is not a hobby pursued for profit's sake. The midget fowls are much more ornamental than utilitarian, but they are engaging in their habits, and give delight to the children of the family and often to the grown folks too, especially those of the gentler sex. Bantams require little house room, and cost little to keep; but most sorts can fly high and easily, so that it is prudent to keep their runs wired over or covered somehow. Their eggs should be hatched by themselves or little fowls like Silkies, and selected small corn should be fed to them with canary and other bird seed, milk-sops, boiled rice, rolled in dry meal, and cut-up kitchen scraps. Shape and feathering being correct in the many varieties of Bantams, smallness is the thing to achieve, therefore breeding should be from the most diminutive stock. Save for the adaptation of all things to size, no variation need be made in the general treatment of bantams from that which is requisite for larger breeds of poultry.

Barredorps. Fowls are hapiazard mongrels, hardy but not profitable, that is to say, not so profitable as those upon the selection of which a little trouble has been expended. They eat as much as the more reliable and purely bred or carefully crossed birds, and therefore their keeping is not to be recommended.

Black Breeds of fowls are well suited for town fanciers, because their plumage is not susceptible to damage by the grime of an urban atmosphere. Here the Minorcas, Leghorns, Crève-Cœur, and Spanish come in, also the Orpingtons of ebony shade; the Langshan is good, too, save for the circumstance that its feathered feet are apt to get clogged and shabby-looking in a limited run range. And all the black breeds almost lay very large white eggs, and endure close confinement well if properly attended to.

Bonedust is a valuable help to the securing of stamina in fowls inclined to leg-weakness. It should be ground from clean dry bones to the consistency of oatmeal, and mixed with the soft meal.

Breeds, Selection of. If number and size of eggs are the main objective of the poultry-keeper, the Mediterranean fowls have no superior, that is to say, those breeds which originated in South European

countries and the varieties obtained by crossing them, the leading sorts are the Spanish, Minorcas, Andalusians, and Leghorns, all long and clean of leg, prolific egg-producers, and comparatively poor table-birds. Other good layers are the Hamburgs, Houdans, Langshans, Wyandottes, Plymouth Rocks, Orpingtons, Game, Brahmas, Cochins, La Flèches, and Polish. Quality of meat is found at its best in the Dorking, Game, La Flèche, Crève Cœur, Wyandotte, Orpington, Brahma, Houdan, Polish, and Langshan. Size and weight are afforded in the Dorking, Langshan, Plymouth Rock, Orpington, Crève Cœur, Malay, La Flèche, Cochins, and Brahma breeds; the two latter, however, expend a great deal of their food energy upon feather-production. If hardness be a chief requisite, all things considered, Leghorns perhaps come first; and in order thereafter Houdans, Wyandottes, Orpingtons, Brahmas, Langshans, Cochins, Minorcas, and Andalusians. For sitting and nothering purposes combined, the approved order in pure breeds may be thus given:—Dorking, Game, Dummies, Silkies, Brahmas, and Cochins. For all-round purposes, Langshans, Orpingtons, Brahmas, Houdans, and Plymouth Rocks are good; and so are well-selected crosses such as the Langshan-Minorca. If brown-shelled eggs are desired, Cochins, Brahmas, Orpingtons, and Wyandottes are well in the running. (See also *Cross-Bred Fowls and Table Poultry*.)

Broody Hens signify their desire to engage in the natural business of *nidification* by going "on the cluck." Should this be the time when the fowl-keeper desires to commence a sitting all well and good. Give the birds their complement of eggs in proper nest boxes, placed in a retired position; the hens will do the rest. But if you don't want them to sit, don't drive them about, or put them barbarously into water, or try to starve them to your way of thinking. Get a small coop with a barred bottom and front; stand it on four bricks in a sunny corner. Place the bird in it in full sight of other fowls and feed it well for three or four days. Unable to sit down comfortably it will soon get over its broodiness, and become lively on being restored to liberty, and commence laying again shortly. But every hen of sitting propensity should be penned to nest now and again, if only for the rest it gives the birds; forcing egg-production and interfering with the laws of Nature too much is harmful.

Buying Fowls is an important matter to the small fancier. He should only buy what he really wants and at the time best suited to his own convenience. These matters having been settled, let him, if possible, go, money in pocket, to the stockyard of a breeder, make his own selection, pay a fair price for the birds he buys, and get them home to the accommodation he has previously provided. Or by watching the advertisements in the poultry papers of the reputable raisers, and communicating with them by letter, he can always get his wants satisfactorily supplied in these competitive days. But he should sedulously avoid unknown advertisers, who purport to be underselling the regular breeders. That way grindling lies. The same caution applies to the purchase of egg settings: go always where there is acknowledged reputation at stake if you want to save yourself loss and vexation, remembering that the best is the cheapest in the long run.

Carriage of Eggs.—Eggs for transit by post or

all should be sent in light strong boxes. Specially made boxes are readily procurable, with stiff card partitions, but any box of suitable size and rigidity will serve. A good plan is to put an inch of bran at the bottom, wrap each egg loosely in soft paper, place them about an inch apart and an inch from the box sides, filling in all round and covering with bran; then lay a soft sheet of paper down gently before screwing or cording on the lid, as the jarring of driving nails is sure to do damage. Mark the box "EGGS," guard against avoidable delay on journey.

Castor Oil used frequently to be given as a purgative to fowls, but the late Mr. Lewis Wright, a great authority on the subject, who put the matter thoroughly to the test, pronounced strongly against its use in the poultry yard; salts or jalap he recommended as aperients in preference where necessary, with the advantage of being followed by no after ill effects.

Chicken Rearing.—For the first day newly-hatched chickens need no food. After twenty-four hours, having first fed the old hen to keep her from gobbling up the delicacies intended for the chicks, give them some chopped hard-boiled egg mixed with crumbs or meal moistened in milk but not made at all pappy, putting mother and progeny under a coop, with a covered clipped grass run in front of it if possible, crumbling the food down on to a board in front of the coop bars, and continuing the feeding just as long as the little ones will peck it up with avidity. After a few days, instead of milk for damping the soft food water will serve, and a few scraps of well-chopped cooked meat will be very helpful, while there must always be finely-cut green food as well, if plenty of fresh grass is not obtainable. Also clean fresh water so placed, that the chicks cannot get their feet into it. Little and very often is the motto for successful chicken-feeding. At the end of a week give one of the many chicken meals which are on the market alternately with the mixture of various small grains known as "Dry Chick Feed." There are many firms supplying such mixtures. This may be continued for months. After this dry feeding only unless the birds are intended for flesh, then continue the mixed diet of soft and dry food. When the dry feeding has become the staple there must be plenty of sharp, small grit about to help the working of the gizzard. Let the chicks run and scratch with the old hen till they are six weeks to two months old. The roosting places provided for them must be quite free from draughts and damp, the worst enemies of chickenhood. They should be on clean straw or dry moss peat till they can perch properly, or their breast bones may become crooked. So soon as the cockerels commence to crow they should be taken away from the pullets, and if the young gentlemen become over-pugnacious, as they sometimes will, it is time to separate them. At six months old, a little extra meat may be fed to the pullets with an occasional mixing of stimulant spice in the meal, to bring on laying. Bone meal may be introduced also twice a week into the soft food for both cockerels and pullets advantageously to assist the upbuilding of their frames; and coops and fowls should be kept clean with disinfectant and insecticide, a little sulphur being rubbed under the wings of the chicks and about the head, neck, thighs, and rump, to keep the lice and fleas away.

Chilled Hens, so rendered by the vagrancy of the sitting hen, a misfortune to which they are liable if the absence of the sitters is more extended than half an hour, or even less in very cold weather, can often be put to rights by immersion in water warmed to one hundred and five degrees or a little over, being kept there until the errant hen has manifested readiness to resume her place on the nest, or some substitute has been secured. Many an unhatched chicken's life has thus been saved.

Cleanliness is absolutely necessary to success in poultry management. The fowl-house need not be ornate, but it must always be sweet and clean, the run dry and free from excreta and refuse, the food troughs and water-vessels rinsed spick and span daily, the perches clear of dirt and verminous insects, the nest boxes whitewashed and the nests frequently renewed,

and the birds provided with a dust bath without the regular use of which they cannot be comfortable.

Cockerels must be either killed off, sold, or provided for separately when they begin to give trouble. They may run together in little flocks, divided from the pullets, until they are quarrelsome; then, unless "mated up," they must be penned apart, each with his own little house and run.

Condiments, or **Chicken Spices**, are very good in their place, when the birds are "a bit off colour." Cayenne pepper, ginger, aniseed, pimento, are all useful, but the prepared powders of reputable vendors given with sugar, according to directions on the package, are usually reliable.

Coops may be of varied form, but they should never be too small, and always rain-proof, free from draughts and dry as to the flooring, being slightly raised above the ground, ventilated towards the top, and fitted with a sliding front to give complete protection in bad weather. Also they must be constantly sweet and clean, whitewashed and disinfected within, and placed, if possible, on a sunny grass plot, sheltered from wind, with a sloping board running up to a broadish sill in front of the bars; the slope to afford easy access to the sill on which the food for the little ones is scattered in their early days, and where the fresh water for their drinking is placed in a simple fountain. These are the only essentials.

Crooked Breasts usually come from encouraging confined birds to roost too early and on too narrow perches. Keep the youngsters to the floor, on straw or litter, till four months old if you can, then let the perches be stout enough to support the breast properly as the birds squat to roost. There is no remedy—save the hatchet cure or killing.

Crop bound may be a distressing condition in a fowl arising from the swallowing of a bone or some other hard and indigestible substance, giving rise to obstruction. It is more an accident than a disease, and may need a simple operation for its relief. First try pouring warm water down the sufferer's throat, then patient and continuous kneading of the crop. If this does not afford the requisite relief, make a careful incision near the top of the crop about an inch long, and remove the contents gently with a small spoon, stitching up the wound nicely with a glover's needle and horsehair thereafter, the stitching of the outer skin crossing that securing the inner membrane.

Cross-Bred Fowls may be well worth keeping if the crossing be accomplished intelligently, the sorts and the individuals being properly selected for a given purpose. One good cross producing hardy offspring is the Houdan-Minorca. The pullets lay good-sized white eggs prolifically all through the winter. The Houdan-Leghorn cross is also satisfactory, and the laying capacity of the Buff Cochins can be considerably enhanced by crossing with the Redcap, the progeny of the two being handsome, and well-suited for a limited run.

Langshan-Minorca crosses give a capital combination of white, juicy meat for the table, and big brown eggs for the basket. A Dorking cock run with half-bred Indian game pullets will produce immense and fleshy poultry, mainly white-legged. The Houdan-Dorking is a fine table cross, too, white of skin and flesh, the pullets laying white eggs. Orpington pullets themselves good layers, mated with a Houdan cockerel, will give chicks which mature quickly and make fine winter egg producers. The great thing in crossing is always to get a good pure-bred male bird to mate with pullets of an ascertained utilitarian strain, first cross or second cross.

Delicacies for Moulting Birds.—Mix three quarters in weight of oatmeal to a quarter of bran, and pour over boiling water. A little chopped-up meat may be given if in small quantities. Leave to swell near fire or in oven for half an hour, and mix with equal quantities of pollard and pea meal, or split peas boiled soft. Hemp seed may be given two or three times a week, and buckwheat is very good. A tonic in the water often helps. A little Epsom salts, or what is known as Douglas's mixture—iron and sulphuric acid. A lump of sulphate of iron and three drops of acid to each gallon of water, or a teaspoonful of tincture of iron will do as well.

DISEASES OF POULTRY.

Poultry are liable to many ailments, more or less serious. The principal diseases which trouble the poultry-keeper and his stock are grouped together alphabetically here for convenience, with brief directions for treatment.

Abortion.—If a hen gets dropping her eggs about, often shell-less, and moves continually, fasten her up awhile alone in a pen with a nest in the corner, give her soft food and a little bi-carbonate of soda in her drinking water. She may have been chased about by a spiteful "gamey" hen, or persecuted by one of the opposite sex. Remove the culprit.

Apoplexy.—Cause: over-feeding and excitement effect, generally swift fatality. Sometimes a cure may be possible if bleeding from the vein under the wing be promptly practised, with jalap and salts aperient, quietude, and spare diet to follow for awhile.

Black Rot.—Symptoms: blackening of the comb, feet and leg swelling, emaciation. Treatment: purge and give warm stimulant food, rubbing carbolic acid vaseline into comb and legs.

Bronchitis is differentiated from an ordinary cold by coughing. Isolate, put nitric acid sparingly into the water, sweetening slightly with glycerine. Cayenne and ginger in the soft food.

Bumblefoot.—Not uncommon in heavy fowls, and arises from a growth under the ball of the foot. Cut away carefully, and if suppurating, dress with antiseptic after cleansing, binding to exclude dirt.

Canker.—Symptoms: ulceration about head and ears, with discharge from the eyes, watering first, then thicker and fetid. Fluid carbolic acid, with lead lotion ointment, may effect a cure.

Catarrh, or common cold, may be prevented from developing into the dreaded Roup by early isolation in a sheltered corner; two or three drops of tincture of aconite and soft warm food.

Cholera.—Chicken cholera is a deadly disease, commencing with a greenish discharge, becoming later white and watery, and accompanied with excessive thirst. Isolate in the shade, disinfect the water trough and replenish often with clean and quite cold water, giving fresh green food and small doses of cholera mixture from the chemist's.

Comb Diseases.—Black rot, chiefly attacking Spanish fowls, has been noticed; White Comb troubles Cochins mainly, and is characterised by white spots which extend to the neck, causing feather-shedding. Treat as for Black Rot, save that a lotion of turmeric and cocoa nut oil is sometimes serviceable.

Consumption, or "going light," is a wasting disease, which can rarely be arrested; but hypophosphates in the food and cod-liver-oil in the meal or with quinine in capsules may overcome the tendency if treatment be commenced early enough.

Cramp is caused by exposure to damp or running over saturated ground. Remove the fowl to a dry warm house, with boarded floor, strawed or moss-littered, plunging the legs first into warm mustard and water for a few minutes, drying well. This may be repeated occasionally until improvement is shown.

Drops.—Soft or Swollen. Usual cause, over-drinking from morbid thirst. Isolate, feed sparingly with soft food containing stimulant spice, and give a very little water after meals with nitric acid in weak solution.

Debility.—Raw eggs down the throat two or three times a day, cooked lean meat, chemical food, cod-liver-oil, a teaspoonful twice a day; such generous treatment may save the life of a costly bird; others so affected should be destroyed.

Diphtheria is a form of canker with internal ulceration. Isolate at once, give an aperient, feed on unpeppered soft food, dress the interior sores with a camel-hair brush dipped in carbolic and sulphurous acid in iron tincture and glycerine, and dust the exterior ulcers, after cleansing, with iodoform. A little brandy in the food may help; but it is only worth while taking this trouble with very valuable fowls.

Dysentery is something worse than diarrhoea, and not so bad as cholera, and should be treated similarly, but a less vigorous, than the latter.

Elephantiasis attacks the fowls with large and coarse scales on the shanks chiefly, and may be contributed to by sudden exposure to very cold wet. It takes the form of unsightly scurf and encrustation of legs and feet, and is very contagious. Curable only in the onset stage, the treatment is carbolic acid oil or glycerine ointment, after scrubbing with soap and tepid water, with weak sugar of lead as a last resort. The birds should be kept on dry ground and given stimulant food.

Eruptions usually arise from confinement and uncleanness; correct the uncleanness, give plenty of green food, especially chopped dandelions, put powdered sulphur in the soft food, and dress the affected parts with carbolic vaseline. Constant scratching of the head is a symptom.

Fits. Try dripping cold water over the fowl's head from the tap, or bleed under the wing.

Gapes. Cause, worms in the windpipe, a frequently fatal ailment of small chickens. Place camphor in the water; strip a small quill feather, moisten it with turpentine, introduce it into the trachea, and withdraw it with the worms adherent, which destroy. Patience may succeed. There are generally ticks on the heads of chickens with the gapes; destroy these with mercurial ointment.

Giddiness, like fits, may be incipient apoplexy. It is manifested by the chick or fowl running dazed as in a circle; treat as advised for fits.

Gout. Swollen and inflamed feet and legs indicate gout. Keep the bird dry, feed up with green-meal, give an aperient, and a half-grain colchicum extract twice daily.

Indigestion.—See the grit-box is well supplied; this complaint usually arises because the gizzard is not working right. Feed moderately on soft food, with a very little lean meat, and give half a pill of rhubarb occasionally.

Inflammation of Rump.—This usually occurs in the gland above the tail where the secretion which fowls use for keeping their feathers sheeny is stored. Open with needle, squeeze out suppurating matter, and foment with warm water, afterwards cleansing with antiseptic solution. Repeat if necessary.

Leg Weakness.—When young birds, especially of heavy breed, outgrow their strength, and squat about on their hocks, bandy legs or knock-knee may result, quite spoiling the bird's appearance. Generally there has been improper feeding. Put some bone-meal in the food of the cockerels and pullets, and give them plenty of barley-meal and sound corn, with cod-liver-oil and chemical food, and a little lean meat. Also let there be plenty of oil, lime rubbish and crushed oyster shell within the reach of the birds.

Liver Disease arises from over-stimulation, confinement, and damp, and is most frequent in the larger Asiatic breeds of poultry. It is hereditary, and birds known to be tuberculous or torpid of liver should never be bred from. Green food and careful dietary may ward it off in early stages, but if the liver complaint has got well hold, as indicated by consistently yellow droppings, kill off the sufferer.

Pale Yolk in eggs may point to lack of sufficient green food. See to this.

Peritonitis may be suspected when a hen, in full lay, with a bright red comb, manifests pain and distress. It is inflammation of the abdominal lining membrane, produced perhaps by over-stimulation of the ovaries. Sometimes holding the hen in a covered basket over steam may do good.

Pip.—A hard and horny appearance of the end of the tongue in fowls and chicks is generally nothing more than the result of nasal obstruction. Give an aperient, put in a warm place, bleed properly, and apply a little chlorinated soda to the tongue.

Pneumonia.—The brachial cough, with very difficult breathing and gasping, often attacks chicks artificially hatched on their emergency from an overheated foster-mother to the air. Rub turpentine into the feathers under the shoulders, bring the little invalid into the warm, feed on milk and bread; give a little antimonial or ipecacuanha wine from a teaspoon.

Rheumatism.—Almost, save for joint swelling, like cramp, and needs similar treatment.

Roup occasions more mortality in the poultry yard than all other ailments combined. It culminates from a common cold, and is highly contagious. A bird attacked with the eye and nostril running, characteristic of this disease, must be shut away from the rest at once, and everything it has been in contact with disinfected. If the roup rattle in the throat has begun before detection, there will be small chance of saving the patient. Pellets of meal with pepper in them may be forced down its throat two or three times a day to keep it from sinking, and a little tincture of aconite given in small pills. Give a jalap aperient, and put camphor in the drinking water. Persevere for a little while, if it be a good bird, but your chance is small.

Scaly Leg.—Treat as if Elephantiasis, and keep the birds in the dry.

Serofula.—A form of liver disease, which see.

Ulceration about the vent, in hens, may be treated alternately with white precipitate ointment, and carbolic vaseline. They should be kept apart.

Worms in the intestines irritate and put fowls out of health. They should be eradicated by turpentine pills or santolin, followed by an aperient. Neglect of treatment may lead to serious results.

Disinfectants are frequently requisite in poultry, and carbolic acid in solution and carbolic powder are very valuable for sweetening the houses and runs, and for cleansing and rinsing the utensils, especially when there has been roup or any other contagious ailment in evidence. A little should always be used in the whitewash.

Dust Bath.—The fowl's way of cleansing is to roll in the dust. Let them, therefore, have plenty, clean and dry, a good depth of it where the sun comes but the rain does not, with a lot of fine ashes in it, and some black sulphur. Clear the lot away occasionally and renew.

Dutch Everyday Layers or "Everlasting Layers" were names given to the "Pencilled Hamburgs" prior to their importation to Britain. The Batavians have long held this breed of birds in esteem for their egg-producing qualities.

Egg-Bound.—Generally an aperient will rectify this, but chopped groundsel rolled in butter is recommended by some; and an olive oil injection, or the passing of an oiled feather (sweet or linseed oil will serve) up the vent and round the egg will often be found helpful.

Egg-Eating.—This is a vice on the hen's part, contributed to by her keeper. It generally arises from the absence of shell-forming material in the run. The hens peck to the shells of the eggs they lay to get the material for forming more shell which instinct tells them they ought to have, and this gives them a deprived taste for the egg which is difficult to eradicate. One hen also sets the others a bad example, and soon many eggs are devoured. Plenty of old mortar rubbish and cracked-up oyster shell should be provided for the hens to pick at in confinement. Then a blown egg or two filled with mixed mustard or a few very rotten ones, should be laid about, to disgust the delinquents who break them to satisfy their unnatural craving.

Eggs, either for setting or incubation, should be kept with the large and downward stood in holes in a board. This preserves freshness and vitality longer than lying them in bran or keeping the small end down. For long keeping some grease or wax the eggs, some store in lime-water or in a paste made from quicklime, some pack in dry salt, some in bran, some bury in an airtight box, but nothing is better than steeping them in a solution of silica or "water-glass" as soon after laying as possible, and keeping in a cool, dry cellar, where the foot cannot come. Don't try to retain hens for laying

purposes after two and a-half years old; an odd bird or two may keep in profit longer, but it will be the exception rather than the rule. Fat forming meals should be largely eschewed when egg-production is the principal object; a warm breakfast is good on very cold mornings and it should mainly consist of cooked and easily assimilable food, and fresh bones and meal help the egg yield.

Enemies of Poultry.—Keep the cats away by wiring, and exclude rats by a good deep concrete, else you will lose birds and eggs in a very disheartening way; mice will nibble your nest boxes and get at any food left about—and there never should be any left about—otherwise the smaller rodents do little harm. Insects are pestilent little enemies of fowls; but they can be circumvented by cleanliness and constant care. (See also **Parasites of Poultry**.)

Fancy Poultry.—Bantams, already dealt with, come under this head; so do all such as are reared and kept more for show than utility; some of the newer breeds of this order may have passing mention. Buff Orpingtons were raised from much crossing at Orpington by the Cooks with an utilitarian end and in view of the rearing of Buff Plymouth Rocks, Buff and Buff-faced Wyandottes, also Partridge Wyandottes, White Plymouth Rocks, and White Indian Game, appear mainly to have been aiming at novelty and pure "fancy." Anconas were "fancy" to begin with, but their egg-producing prolificacy rescued them from the merely ornamental state. Silkies are fine sitters, but count more in the beauty category than for practical usefulness, and the Japanese Long Tails are quite bizarre, and belong to the aviaries of the monied fancier, as also do the various Frizzled Fowls, Naked Necks, Sultans, Ptarmigans, Rumpless, Fowls (or "Cock of the Woods") from Persia and Ceylon, and certain other poultry curiosities which have their admirers amongst the wealthy.

Fattening for market is a process carried to a great length by the "craemers" and "combers" of the Continent, and at several British establishments of a specialistic sort; but less extensive poultry raisers find it answer to go some distance in the same direction for profit's sake. The principle striven for is after growth has been attained to give seclusion and rest from everything else but the business of plumping out. The birds are confined in semi-darkness and tempted by stimulant food to eat as much as can be got down their throats. Ground buckwheat, crushed Oats, maize meal, etc., form the staple diet with the addition of suet and other fats, moistening with milk.

Feather-Bating is a pernicious habit in some fowls that have been fed on heating and stimulant food, and kept closely confined. Laziness from repletion and lack of health-promoting activity often starts it, and when a bird in a batch begins the practice, others retaliate, until the whole pen presents a sorry spectacle. Change the diet, give abundance of green food; put short straw or moss litter on the floor and bury their corn to make the birds scratch for a living; this will give them something better to do than stripping off their own feathers and those of their miserable companions. Also hang up the green food in bunches on a string and make them jump up to get it. If this fails to cure them, wring their necks.

Feathers are of some economic value in fowl-keeping; carefully kept and properly cured by bakings and dryings. They are not nearly so good for bed-stuffing as the downy breast feathers of the goose, of course; but well selected, and the larger ones stripped, they come in well for pillows, bolsters, and cushion making.

Feeding of Poultry requires proper consideration and systematic regulation. Over-feeding—save for fattening previous to slaughter—is distinctly bad and disease-inviting; whilst mal-nutrition, or the giving of improper food, is only less harmful in degree. The dietary should be wholesome, varied, sufficient; and no more. In dealing with chicken-raising we have indicated the best practice as regards immaturity. For grown fowls with a free range two meals a day will be enough; one in the early morning when they are let out of the house, and the other in the evening before going to roost. These will pick up green food and much supplementary aliment during the hours of

roving. Confined in a small run birds should have a slight breakfast of soft food, meal moistened with scalding water and mixed with scraps is good. Before mid-day a handful of loose corn per bird may be scattered and covered to be scratched for; green food, such as cut grass or anything else available, may be given an hour or so later. Last thing, a feed of good sound grain should be supplied. As to quantity, as much as the fowls will eat greedily is a good standard to go by, always rather leaving them a little hungry than allowing anything unconsumed to lie about. They want less when not laying than when in the swing of egg-production, and still less during the moulting periods. Half-a-pint of grain a day should suffice for half-a-dozen healthy adult birds. The soft morning food is best if fully cooked, being most easily digested thus, but scalding will serve as an occasional alternative; the kitchen waste should be incorporated. Bones need to be dried and ground; they are splendid poultry food. Of grain, good hard wheat stands first in value; barley and oats next. Indian corn should be given but sparingly; it is too heating, except in the northern counties, and where birds have free range. **Bandaging.** Band.—When the **sceding** of chicks is difficult and retarded, warm milk should be given to help them on, and a little tincture of iron put into the drinking water.

Fractures of the shanks in fowls are easily set by replacing the broken bone in position, and securing with splints formed of folds of porous brown paper saturated in white of egg. Other bone fractures sustained by fowls are very difficult to mend because of the restless disposition of the birds, but bandaging may be attempted with valuable fowls which have met with an accident of this painful character.

Frost Bite may be prevented in severe weather by well oiling the combs and wattles of the birds, or rubbing in vaseline, so as to prevent the adhesion and freezing of water after the act of drinking.

Grass Runs are grand things for fowls if sufficiently large enough to retain their greenery on constant usage; but otherwise they are better not attempted, for a defoliated patch from which the grass has been nearly scratched and trampled away is unsightly and injurious. A small plot of grass, kept closely cut, is very good for young chickens; but for the older birds the grass range should be very extensive to be of practical service.

Green Food.—"Plenty of it" is the order for the would-be successful poultry-keeper to observe. Growing greenery, picked and pecked by the birds ranging at will, is best; next best, the fresh cuttings of the lawn, short and sweet, and not thrown into the runs in such profusion as to be left lying to rot. Cut up lettuce leaves, cabbage leaves, dandelions, cress, and anything else fresh and assimilable should be supplied to the extent the birds will eat it up clean. Don't permit cabbage stalks and mid-rib to stay in the run to decay and render the place unwholesome.

Grit is indispensable to fowls in captivity. It forms their teeth, without which their food cannot be properly digested in the gizzard. The grit must be hard, angular, and sharp to be of full service, and nothing equals flint broken up small. Smooth gravel is of little service.

Hens, as a rule, should be killed off at the age of two years and a half, when the first sign of the moult appears. Their best laying days are then over, and they will henceforth, if allowed to live, deteriorate for table purposes. Very fine and valuable birds may be retained for breeding purposes, but even they are better cleared out of the way to make room for their juniors. (See also **Broody Hens**, **Mating** and **Milking Hens**.)

Houses for fowls should be so designed and built as to give the requisite accommodation for the poultry intended to be kept. They need not be costly or ornate. The simpler and better constructed they are the more satisfactory they will prove. Suit the size of the house to your requirements, let it face the south if possible, and let it be wet-proof and wind-proof, the floor elevated from the ground, with a hen ladder giving access from the run to a little closeable entrance door at the front, and let there be a big door at the

back to facilitate cleaning. Put your perches on one level well below the essential ventilation holes towards the top of the house, and light it by a small window either at the north side over the door, or in any other convenient position. Both light and fresh air are wanted if you would keep your birds in health. If you "go in" for Brahmas, Cochins or Orpingtons, you will need only very low broad perches, or none at all, and you must have plenty of clean straw or moss litter on the floor; if with dry sand, ashes or lime dust amongst it all the better. If the floor be raised and boarded, a layer of concrete or asphalt upon it will be good for securing dryness and excluding vermin; and this will be even more necessary should the house bottom be the ground.

Incubating—Artificial.—This is a process rendered fairly easy to all poultry-farmers, female as well as male, who have at command a dry and airy room and any one of the many makes of incubator manufactured by reliable firms. The best—size and extent of course being a governing condition—are those which are at once the costliest and cheapest, an imperfect incubator "is dear at a gift." The capacity of the incubator should be such that its possessor may have accommodation for the produce of; and its working will require the unremitting attention of the person in charge. It should stand on a firm table in a well-ventilated position where there is no draught, and the heating apparatus be regulated to maintain a steady temperature of from 102 to 104 degrees, whilst the provision for airing, turning and moistening the eggs must leave nothing to be desired. Study of the directions given with the incubator and practical experience of its working can alone make its management a success. An Artificial Foster Mother, or Reaver, will be requisite to receive the chicks after hatching, this being a portable construction containing a glass covered run and a wired-in run in front of a chamber into which the chickens can come and go, as they will, such chamber being kept at a uniform heat of 60 to 62 degrees, according to the outside weather, and the whole concern being readily cleanable. The "Foster Mother," of which there are numerous satisfactory makes in the market, must be placed in an apartment the air of which can gradually by full and free ventilation be brought to coincide with that out of doors, so as to obviate chill when the chicks have to be transformed to the open. The feeding of the youngsters should be similar to that recommended for hen-hatched chicks.

Infertile Eggs can be detected readily by the fourth day of incubation, and even earlier, by experienced persons by holding up to a strong light; if they then look perfectly clear they should be withdrawn from the nest or incubator and used for culinary purposes. Should too many hens be running with one male, or the cock bird be lacking in virility, this will occur, and it is obviously useless to waste time over trying to hatch eggs which are infertile.

Iron is useful in the drinking water of fowls in cold or wet weather, giving "tone" to the birds. A teaspoonful of the tincture of steel is very serviceable.

Killing Poultry should be swiftly and humanely accomplished. Tie the legs quickly and firmly, and dislocate the neck with a quick wrench of the wrist of the right hand, the neck being grasped lightly by the left; or chop the head clean off at one blow with a sharp chopper, the neck being laid on a solid block. Either of these plans is better and quicker than severing the jugular or penetrating the brain through the mouth with a knife. Some strike the fowl smartly and heavily on the back of the head with a stout stick or block of wood, and if this be done deftly instant insensibility and death will be the result. Hang the bird up by the feet for the blood to drain downwards.

Lime is essential to the welfare of fowls, and for the formation of the shells of their eggs. It should therefore always be provided in some form in the runs, and clean old mortar is a ready means of its supply. Lime that has not lost its "quickness" by use and exposure is apt to yellow the plumage of white-feathered birds, if laid about profusely or employed too freely as a component of the dust bath.

Mating should be arranged as to number of hens

allowed to run with one male, according to the breed. The Houdan is particularly active, and the lighter classes, such as the Hamburgs, Minorcas, Leghorns, and Wyandottes, can have more hens in the pens than the heavier birds like Brahmas, Cochins, Dorkings, Langshans, Orpingtons, etc., without prejudice to the fertility of the eggs. In this particular, season makes a difference too, the eggs laid very early not being so certain to hatch as those on setting as those produced in the spring and summer.

Moulting is a "ticklish" time with most fowls, though a perfectly natural condition. Everything proper should be done to help the birds over the moult. Those with the most vitality get through the feather-shedding and renewal the quickest. Old birds are long shabby; they should be got rid of altogether. Hens slow of moulting through being "run down" by heavy laying should be placed apart, given specially generous feeding treatment, and supplied also with a suitable tonic, such as iron tincture in the drinking water. (See *Dilemmas for Moulting Birds*.)

Nests and Nest Protection.—Nests, generally speaking, are best in their natural position, on the ground, whence the eggs derive the necessary moisture. A little soft straw, confined between two bricks, in a secluded corner where the rain cannot come to the sitting bird, is all that is really requisite. Fern leaves are good nest material, insects do not seem to relish the smell of them. Whether for incubation or for mere egg-laying, the nest-boxes, if such there be, should be placed in privacy, but yet readily getatable by the owner or attendant, well-ventilated, and scrupulously clean. If of wood, scour and whitewash them frequently, and renew the bedding often. By no means have them exposed to cold, though airy; but let the position be such as to protect against wind and frost, so that the eggs of a sitting hen may not be chilled unduly in winter, or very early spring time, when she gets off for food and exercise.

Oyster Shells smashed up well, are capital for laying fowls, for the lime in them is good for the birds and the eggs they lay, while the harder and less soluble portions render the gizzard to grind the food.

Parasites of Poultry.—lice will swarm on the birds, their perches, nest-boxes, and the houses they inhabit, if cleanliness be not observed by the poultry-keeper, and the proper dust-bath be not provided. But if there be regular and thorough cleaning out, and whitewashing of the whole interior arrangement at least twice yearly with good hot lime in which sulphate of iron or even paraffin is mixed, with occasional spraying about of dilute carbonic acid, or dusting with some good disinfectant powder, there will be little trouble from lice or any other vermin. The dust-bath should be sifted and renewed frequently, and sulphur may be scattered over it occasionally.

Peat Moss Litter is an invaluable material for strewing thickly over the floors of fowlhouses, so long as it can be kept dry. If permitted to become saturated with damp it is dangerous. It should be crumbled down fine, and frequently stirred or raked about; and then acts as an absorbent and deodoriser.

Perches ought to be wide enough to afford support to the breastbone of the bird, a good height in the house and out of a draught, with none above any other—else there will be warfare for the highest vantage point—and free from cracks or interstices in which lice may lurk.

Pucking.—Poultry should always be done when the bird's body is still warm, as the feathers come away much more easily than later. If necessary the fowl may be singed after stripping, but this sometimes discolours the flesh.

Poultry Points.—A few technical terms used in the poultry "fancy" may be explained. Deaf ears are the ear-lobes or skinny folds hanging below the true ear. Gills or wattles, the red pendent structures at each side of the beak. The narrow neck feathers found also on the saddles of the cock-bird, are called "hackles." "Pea-comb," a triple comb, like three in one, the central part the taller of the three. Fencilling, small striped markings across or down the feathers. Saddle, the part of the back nearest the tail in cock-birds; usually called the cushion in the hen. Shank,

the scaly portion of the leg. Sickle, the upper feathers of the tail covert in the male birds, often long and gracefully curved. Top-knot, or crest, the crown feathering of birds like the Polish, Crève Cœur, and Houdan. Vulture-hock, projecting feathers on the hock-joint, as in the Brahma. Wing-bar, a line of contrasting colour across the middle of the wing, caused by the variant marking of the lower coverts. Wing-bow, the shoulder of the wing.

Profitable Poultry.—Poultry, properly selected, managed and cared for systematically, according to the counsel given throughout this section, will be profitable. Where all the food has to be purchased, if it be bought in the best market and none of it wasted, the keep of a hen will come to about six shillings a year. If she be well chosen and dealt with as we have endeavoured to direct, she should average 150 eggs a twelvemonth for the two years of her full laying life. There is a fair good profit on the eggs alone here; and she and her fellow hens should pay for the keep of themselves and the cock easily. For sale or home consumption when she goes out of profit, she should be worth as much as she cost up to the time of laying her first eggs. Haphazard poultry keeping, inattention, the extravagant purchase of useless appliances, and, above all, the stocking of unsuitable birds and their retention in the yard beyond the proper period, will most certainly result in loss.

Pullets, Care of.—The term "pullet" is not properly applicable to a young hen fowl after the end of the year in which she was hatched, but it is generally so called during the early months of the year following. The young birds should be quartered apart from the cockerels when the pullets' combs commence to reddish and the cockerels begin to crow, and give plenty of grit and oyster shell as well as green food. If they are over-precocious and lay their first eggs as early as five months old, as some pullets will, they may advantageously be kept back a bit by transference to another run. Let the development of all the organs be complete before mating up and encouragement to full laying. Only the best and most promising pullets should be selected for stock, the rest being fattened and killed for the table or otherwise disposed of.

Roosting should not be encouraged in chickens, till they are about four months old, that is, on the regulation perches. It is far better for them to squat in the straw or moss litter on the fowl-house floor, away from the perches overhead, or a smooth, broad shelf may be fixed for their benefit about a foot high, and parallel with the perches, on the warmest side of the house. Sprinkle this with sand and ashes, and strew broken straw upon it, with more dust on the top of it to prevent the adhesion of droppings to the plumage and frequently sweep the board clean.

Runs should be as large as there is space at command for, covered in by a water-tight roof at the top if possible, and constructed with an open-wired front and a wind-proof back and end, either of boards or brick. The wiring should be stout, well-meshed from about 12 to 18 inches below, and 6 inches high, to permit of walking about in and cleaning with facility. Have it in a dry place, facing west or south, to afford shelter from the more trying cold winds, and let the floor be of gravel or sifted ashes, laid thickly on the natural ground. Give access by a wired door, preferably close to the front of the fowl-house, where the birds enter through their own sliding door.

Setting. Secure and select the best eggs obtainable. The trouble entailed in hatching and rearing a poor bird is as great as the best requires, so that the first cost of the egg is by no means the only consideration. Get the most reliable eggs you can for the purpose you have in view in breeding. Let the shape, if you personally select, be perfect, and the size normal, according to the standard of the breed. The number of eggs should vary according to the size of the hen, a large bird like a Cochins can cover thirteen easily, a smaller fowl will find difficulty with less; an 11 fewer ought to make a clutch in cold weather than a warm; nine to eleven is a good average. Let the bird be set as soon on in the year as convenient, for the earliest profit, in a dry, quiet corner out of reach of molestation on the ground, a hollow lined with soft oat

straw making a good nest. Dust the hen on the under parts with pyrethrum powder before she begins her three weeks' sitting. This will prevent her being bothered by insects. (See also **Nests**.)

Show, Preparing for.—A few hints on preparing choice birds for exhibition may here be given. If there be any tendency to scurf or scale on the shanks, get these clear by scrubbing gently with soapsuds and an old tooth brush three times a week; and anointing with sulphur and neatfoot oil or vaseline, after wiping dry. Give the bird powdered charcoal in its food to clear the system and impart tone, and a fair amount of fresh linseed twice a week with its corn; this will afford gloss to the plumage. Let the dietary be varied and the exercise ample, making the specimen scratch for its food. A little cooked meat daily, fed out of the hand, will help to give condition, also render the bird tame. Cleanse the wattles, comb the face with a soft, damp cloth, and when dry rub vinegar over them with a small sponge to give extra brightness. Wash the birds thoroughly all over, and very carefully, the day before sending off to the show.

Sitting Hens.—Supplementary to the paragraph on "Setting," a few further hints on the management of the sitting hen may here be given. When she goes broody put her on "pot" eggs first; if she settles to sit steadily, the first time she goes off to feed, replace these with the eggs you want to hatch. Let her off regularly, and at the same time daily for food, drink, exercise, and dusting; she should be away from the nest ten to twenty minutes. Sprinkle the eggs with lukewarm water occasionally during her absence, and if any egg has got broken accidentally remove it and cleanse the rest; this is most essential. On the fourth day, if you can manage it, examine each egg carefully to see whether any remain translucent; if they do, remove, for they are clearly infertile. If they are cracked slightly during incubation, neatly mend with strips of thin gummed paper or gold-beaters' skin. Should any chicks hatch out on the twentieth day, remove them, directly they are dry, to a basket lined with soft flannel indoors near the fire until the rest "come off." Don't attempt to feed the chicks thus removed. They have enough egg yolk inside them to sustain them for twenty-four hours. Put hen and chickens under a properly prepared coop when the "clutch" is complete. Feeding the youngsters with chopped egg, oatmeal, etc., must commence when they are a day old, as directed in the paragraph on "chicken raising."

Soft Eggs are a sign of functional disorder or disease in the hen, often arising from over-feeding; sometimes their origination may be traced to the absence of shell-making material in the run. Reform the dietary in the first case, repair the omission in the second. Pounded raw oyster-shell has the quickest effect of any shell-forming substance available for poultry-keepers.

Sulphur, powdered, in the moulting period, and to hasten egg-laying, is good for pullets and hens alike, a small half-teaspoonful to each fowl twice a week.

Table Poultry.—Reference to the paragraph on "Breeds" and "Cross-Bred Fowls" will show what kind of birds to select for the best meat-producing results. The desiderata are quick maturity, meatiness,

white, fine-flavoured and firm flesh—especially of the breast, which should be broad, long, and deep—and size. Beauty of plumage and other fine points are of no consideration, and oviparous fecundity does not matter at all in birds bred purely for slaughter. But fowls with white feet and legs market better than the yellow-shanked sorts.

Trussing for market should be simple; setting the hocks back and the wings into shape and securing the legs is all that is requisite after plucking. Further preparation for the spit should be left to the purchaser and the cook, as should the "drawing" of the birds, for anything that entails cutting the skin or flesh of the fowl assists decomposition, which the raiser certainly does not desire to have expedited until his financial interest in his produce is ended.

Water Troughs should be simple and easy to cleanse. A good deep earthenware saucer with a garden flower-pot inverted in it is good, inexpensive and effective, in that it leaves the drink accessible to the beaks of chicks and fowls of larger growth without affording room for the feet of either. There are many good glazed earthen-ware "fountains" to be purchased cheaply; also convenient galvanised "tip-over" metal troughs for insertion in the frame work of the run, readily removable for scouring, and accessible from outside for replenishment. The chief essential is cleanliness of the utensils and their constant refilling with perfectly fresh and cold water. The position of the vessels should be sheltered, for sun-warmed drink is both disagreeable to and bad for poultry. (See also **Winter Management**.)

Winter Layers.—Perhaps the best fowls for egg-production in winter are the Orpingtons, Brahmas, and crosses between the Minorcas and Langshans, Minorcas and Wyandottes. Hatch these kinds of birds as early as you can in the season; they will get over their moult and commence re-laying very early. Thus it will be seen that to be sure of winter eggs you should choose not only the proper hens but the proper time for their launch into life.

Winter Management.—Warmth is essential for the maintenance of fowls in full vitality. Carefully exclude all draught from the hen-house, whilst retaining full and free ventilation. Let the runs be sheltered from cold blasts, and the food varied and wholesome, nourishing, appetising, and comfortably hot without being over-stimulating.

Worms are not the best food for fowls as a rule, though they will scratch for and greedily devour them. The most dangerous worms for poultry dietary are the larger earthworms from the runs which have become at all fouled, for the bodies of the wigglers may have given lodgment to the pestilent germs of the tapeworm and other enemies of warm-blooded animals. (See also **Parasites and Diseases**.)

Wry-tail is a great fowl disfigurement, wherever it occurs, and is apt to become hereditary, so that it is as well not to breed from birds thus deformed. Some breeders, when it does not do to spin out, essay a surgical operation for the correction of wry-tail; but this is hardly worth while, save in the case of youngsters likely to make in all other respects fine exhibition birds.

BREEDS OF DUCKS.

Useful and Ornamental.

Aylesbury.—Unsurpassed for table purposes, pure white in colour; bill should be pale flesh-tinted, not yellow; eyes blue, body long and deep, ready for market at eight weeks old.

Brahma.—An ornamental variety, light brown, pencilled dark; a similar duck is found at the Cape of Good Hope.

Black Cayuga.—Early maturing, lustrous black, as large as the Aylesbury, blue-black bill, shanks bronze or dark slaty; good layers, fine fat.

Black East India.—Small size (smaller the better for show), glossy plumage, black feet and legs, drake's bill orange, duck's black, small boned, good layers.

Call Ducks.—"Fancy" birds, grey or white, used

occasionally as decoys, small, the white varieties have bright yellow bills, very lively.

Campbells.—Introduced by a Gloucestershire lady of this name a few years ago, by hybridisation between the Indian Runner Kouen and wild ducks, which latter they resemble; rather small, but grand layers.

Carolina.—The summer or Wood Duck of America, a beautiful variety of ornamental water fowl, closely related to the Mandarin, red bill, black margined, surcled at the point; glossy green crest; throat, collar, over the eye and belly white; breast chestnut, cheeks and side of the upper neck violet; back dusky bronze tinged with green; side, under wing, fine lined with black over drab; tail deep black tinged with yellow;

wing spot blue and green, not so bright in the duck as the drake; yellowish red legs and feet.

Cayuga.—The large American black duck. (See **Black Cayuga**.)

Crested.—An ornamental duck, with a pretty top-knot.

Duolair.—A cross or sport from the familiar Rouen duck, much marketed in France.

Falcated.—Black pencilled in the drake on silver-grey ground; head purple glossed with green and crested, throat white; almost as beautiful an ornamental duck as the Carolina and Mandarin varieties.

Indian Runner.—Chiefly fawn and white, small but unequalled as an egg producer. When crossed with the large ducks makes a bird of value for table, and prolific as to laying quality.

Japanese Teal.—A very beautiful bird, allied to the Mandarin; the drake especially being handsome of plumage. The female resembles the Mallard.

Mallard.—The white duck, or Mallard, is sometimes found amongst the inhabitants of ornamental duck ponds.

Mandarin.—Sometimes called the Chinese Teal; the most gorgeous of all the ornamental ducks, and quaint of appearance; very small, and affectionate in their pairing, though the drake is apt to be quarrelsome with other males of his genus, and with ducks to which he has not been properly mated. A broad cream-coloured stripe extends from the front of the sides of the head, across the eye, to the back of the neck. A variety of bright colours appears over the body, and the bill is crimson.

Muscovy, or wild Musck duck.—Very large, the drake often reaching over ten pounds in weight; mainly black and white in patches; flesh good when eaten young; lays few eggs, the male fighting anything he comes near most pertinaciously.

Orpingtons.—These have been bred by members of the Cook family of Orpington, who also originated the Orpington fowl. They are found in two colours at present, buff and blue. They are shapely, good-sized birds, following the Rouen somewhat in shape, and the Indian Runner in style and carriage. Like the Orpington fowls they have great utility properties, being good layers and carrying a fair amount of flesh. They are hardy, and mature quickly, thus may be said to be good all round utility birds.

Fekin.—Fine uitarian duck, good-flavoured flesh, hairy, fast-growing; very large, pale straw or cream-coloured, deep yellow bill, long deep bodies, downy, reddish-orange shanks.

Penguin Duck.—An ornamental bird, marked by the downward tendency of the rump.

Rouen.—Well described as a larger and tamed wild duck; handsome and utilitarian, a capital layer, but rather late in reaching maturity; the drake has a greenish-yellow bill, black at the tip; head and neck

lustrous green, with white, ring low down towards the breast, which latter is rich claret; back grey and green, under-parts grey; tail black, bright blue wing bar.

Runners.—(See **Indian Runner**.)

Spotted Bill Ducks.—Rare fancy birds from India, with a peculiarly bright green wing spot, pale brown breast all spotted with dark dots like a trout, jet-black bill with yellow tip.

Summer Duck.—(See **Carolinian**.)

Teal.—The ordinary British Teal and the Garganey Teal are not found on ornamental lakes, nor is the Japanese Teal.

Whistling Ducks, sometimes called "Tree Ducks," because of their habit—in common with the Mandarins and Carolinas—of perching on boughs. The White-faced Whistling Duck is handsomely pencilled and many coloured; the Red Tree Duck is even prettier.

Duck-rearing Notes.—Ducks are naturally hardy birds, and readily adapt themselves to circumstances. Of course they are waterwield, but they can be kept profitably with the merest apology for a pond to disport in or with none at all if intended for early killing. However the duckpond is constructed, it should have its side sloping easily down to the water, to enable ducks and ducklings to get in and out without difficulty. Also provision should be made for cleaning out the artificial pond frequently, especially if it be of small dimensions, for ducks are dabblers at fouling water. The duck-house never need be an ambitious affair; any dry, well-ventilated shed will do, the floor covered with clean straw for the birds to lay their eggs in. Fasten up the birds every evening and they will usually do their laying during the night or early morning. Mate four ducks with one drake soon after the moult, and feed them extra well to get eggs almost daily until their batch of from ten to forty has been laid, then they will rest for a few weeks. Hens will hatch and mother ducklings very well; the incubatory period is twenty-eight days, but the duck is a good siter and may be allowed to hatch her last batch. Hard-boiled eggs, coarse meal or breadcrumbs moistened with milk, grits, fine shredded meat, with plenty of cut-up greenstuff, especially lettuce, form the best food for the ducklings for the first three or four days, after which the eggs and milk—moistened food may be discontinued; but plenty of meat should always be given, and fleshy refuse which is not diseased or tainted being acceptable to these omnivorous feeders. After the second week ducklings with any range will pick up a lot of slugs and insect food for themselves; but besides this they should be fed regularly three times a day with boiled rice, barley-meal, sharps, household scraps, and anything else handy, giving them on each occasion as much as they can gobble up clean. At ten weeks old they will be fit to kill, and that is the most profitable way to dispose of the bulk of them.

GEESE.

For Food and Fanny.

Canada Goose.—A handsome and ornamental long-necked bird, an aboriginal of North America, half-way between swan and goose in general form. Head, bill, and greater part of neck black, with a peculiar white cravat at the throat, body grey, grading to nearly white underneath, wing, quills and tail nearly black, grey-brown eye, long, lead-coloured legs and feet, imposing carriage, swan-like and graceful on the water. Makes less gross eating than the ordinary goose. Average weight, 9 lbs.

Chinese Goose.—Is in two principal varieties, both great egg-layers, though the size of the eggs is but two-thirds that of the common goose, which only lays about fifteen times on an average during any year, while the Chinese will lay as many as thirty for a "clutch" three times or more each season. Midway between swan and goose in size, and pretty in form. A night swimmer with a harsh note. One sort is white, with deep blue eyes and orange pale brown-striped down the back of the neck, shanks, and bill, and a large black knot at the base of the latter, from which

it is sometimes styled the "Knobbed Goose. The brown variety, so-called, is predominantly yellow-grey, with darker brown stripe down the back and neck, and very dark brown bill and eyes, dark orange shanks, and a feathered "dewlap" under throat. Occasionally called the "Spanish Goose."

Careopsis Goose of New Holland.—A very handsome fancy water fowl, but the gender is even more of a fighter than his Egyptian relative, if possible, and a "positive terror" on a pond.

Danubian or Sebastopol Goose is pure white, curiously frizzled, the plumage being soft, silky, and turned back. Weight about 15 lbs. Not uncommon on the Danube, but the first specimens came to Britain from the Black Sea. Interbreeds with the common goose.

Egyptian or Nile Goose is tall and slender, grey to black on the upper parts, pale buff beneath the breast, beautifully pencilled with black, chestnut patch round the eye, purple bill. A strong flier and incorrigibly pugilistic.

Emden Goose.—Very big and white, square bodied, waddles along close to the ground when fat. Flesh-coloured bill, orange shanks, bright blue eyes, long winged. Comes from Emden in Westphalia. Ganders will weigh 20 lbs. or more. Matures rapidly.

Gambian Goose, or "Spur-Winged" Goose, from the powerful spurred formation on the wrist-joint of the wing. Has a large excrescence at the top of the base of the bill; grey black save as to cheeks, throat, and under parts, which are white. Bill and legs dull red. Shy and tall, and smallish as to size. More ornamental than useful.

Indian Bar-headed Goose, has three black bands across the back of its white head. A distinguished-looking bird for ornamental water.

Italian Goose is the newest importation to Britain amongst the family of utilitarian geese. It weighs about 15 lbs., is a good forager, and almost as

prolific an egg-producer as the best layers of the Chinese varieties. It is a non-sitter, a quick maturer, and finely flavoured.

Magellan Goose, sometimes styled also the "Chilian Goose," is prettily shaped on breast and back and gentle in association with other water-fowl.

Nile Goose. (See Egyptian.)

Sandwich Island Goose. Hardy and prolific, much bred and sold for "fancy," in Belgium.

Sebastopol Goose. (See Danubian.)

Toulouse Goose. The giant of the Anserine group, and a good layer for a goose to boot. One extra fine pair will weigh 60 lbs. together. Grows to a big frame quickly, but puts on flesh rather slowly. Comes in for Christmas well. Grey of colour, darkest on the back. This is the bird whose liver is swollen by confinement in heat to an enormous size to make the *foie de Jais* gras that epicures profess such fondness for.

GEESSE REARING NOTES.

Geese require a wide range of liberty to do well, and common or pasture land, with a pond by the way, to rove over in flocks unmolested. So kept, and with stubbles to forage in during the autumn, they will pick up the most of their living, and thrive and fatten exceedingly. Fed in the mornings before being let out for the day, and in the evenings before retirement, they will generally return to the homeyard with regularity, after a little early teaching or driving; but if not, a little child or even an intelligent dog will lead them to and fro quite easily. The ganders, however, will speedily show fight to any unchivalrous meddler; and sometimes put strange children and timid women folk to fearsome flight with their hissing and rustling onslaughts of bill and wing. They want a dry and airy shed, bedded with clean straw, to sleep in. Three geese may go to each gander, and they should be mated up as soon after moulting time as possible, and given extra liberal dietary to bring on the egg-laying.

The eggs, which take thirty days to incubate, should be "set" under broody hens of the Brahma or some similar large breed, four or five to each hen. Damp the eggs with lukewarm water twice a week or so when

the foster mother is off feeding. When the goslings hatch out they will not require very much attention, being very hardy; but, being likewise very voracious they will want a lot of feeding. What is good for chickens is good for goslings, only more of it is needed with plenty of flesh meat and green stuff; spring onions are good, in supplementation. In bringing on the youngsters for market let them have their run for development daily, and liberally feed them with meal, corn, turnips, and potatoes, at both ends of the day; then for the last three weeks of their short life keep them in confinement and induce them to cram as much as they will with Indian corn, oats, and boiled potatoes. Brewers' grains and kitchen scraps of all kinds are also helpful to prepare the goslings for consumption as "green geese" at Michaelmas, about which time they are best for the table. The big older birds are grosser eating. They rarely lay till over a year old and will live to a great age if enabled to do so, breeding for many seasons. The big Emden and Toulouse geese, and cross-breeds fattened up for the Christmas markets, are usually three-year-old, or at least two-year-old birds. Some geese sit very well themselves, and then bring up their brood with exemplary attentiveness.

SWANS.

Swans in the wild state are met with everywhere but in actually equatorial regions. Two species are common to both Europe and America, and a third, of well-marked differentiation, in Australia.

The Mute Swan is the largest and best known of all the Cygnus group. Spotless white on every feather, its slender curving neck, red bill with a large black protuberance at the base, soft brown eye, and dark feet are familiar. It is not mute as the name would imply, but its voice is softly musical if somewhat melancholy. There is a variety, equally large, but slightly different as to shape of cranium, to be found on the Baltic, and called generally the Polish swan. Its cygnets are pure white from the egg onwards, thus variant from the true Mute Swan, whose young are hatched grey, and long remain so.

The Whistling Swan is also white, slightly smaller than the Mute Swan, with shorter and thicker neck, and yellow bill without the black bump at the base. It has a tuneful voice, and many sweet notes frequently come forth, especially when on the wing. When wounded or distressed, those are prolonged and accentuated in volume, and no doubt give rise to the old legend of the Swan song, which Shakespeare had in mind when he made Emilia say in "Othello"—"I will play the swan and die in music." Berwick's swan is a still smaller white bird, slight and short of neck.

The Black Swan from Australia is well known now the world over. Not quite so large as the Mute Swan, it is sooty-black to grey of plumage, scarlet-eyed and red of bill, the latter being white-tipped. These Antipodeans are not quite so quiet with other water birds in collections as their white relatives are.

The Black-Necked Swan comes from South

America, and is sometimes known as the Chilian swan. Its neck and head are jet black, the rest of the body white. The bill protuberance is most marked, and red of colour, the bill itself being of a leaden hue. This bird swims with the neck straight like a goose, and its cygnets grow with great rapidity.

Swan-keeping.—Given a stretch of water and some privacy swans of the common breed may be trusted to look after their own affairs. They make an enormous nest close by the water in which the hen lays six to nine thick-shelled, dirty-white, green-tinted eggs. These take thirty-five days to hatch, and the downy-grey cygnets are taken into the water by the mother at two days old, both the parent birds giving their young the most assiduous attention. A few grouse or a little coarse oatmeal thrown upon the water will be eaten with avidity by the youngsters, and corn may be fed regularly to the old birds; or a trough by the edge of the stream or pond may have suitable food placed in water for the benefit of the whole family, who are models of affectionate attachment. The cygnets may often be seen on the back of one of the old birds whilst swimming. Swans fly well, for such great birds, when once fairly on the wing, but get up into the air with some difficulty, and always from the water. Their flesh is considered good eating when the birds are young, and used to be much esteemed at the tables of the great. They live to a great age, and resent interference, especially during the sitting period and when the cygnets are small; at these times the male swan will exhibit pugnacity on the approach of any intruder, especially if a stranger. The young are very nardy. Swans pair for life, and in the wild state migrate from place to place in flocks. They will swim long distances in streams or rivers.

TURKEYS.

Utilitarian Turkeys.—The great "gobbler" of our farm yards came to us first from across the Atlantic two centuries ago. He was a wild aboriginal roamer of the prairies and brush of North and Western America, and occurred in a varied form in Mexico, Yucatan, Honduras and the whole central portion of the New World. To Britain he took kindly and the Eastern Counties suited his development particularly well. In Norfolk the turkey-raisers fixed a type which secured high favour for the Christmas table, black, spotted white on the wings, and fine of flavour, but not usually so large as what came to be called the Cambridge turkey, tawny grey of feather. Both breeds have latterly been improved considerably by the introduction of new blood from the mammoth cultivated bronze breeds of America. Size, quality of flesh, and length of breast are much more sought after in the marketing turkey of to-day than beauty of appearance or purity of pedigree. There are white turkeys to be met with occasionally in the yards, but they are not encouraged, being supposed to be delicate constitutionally. The Cambridge "bronze" predominates in the stubbles of East Anglia because it comes to greater size than the darker Norfolk variety, though the latter gives the whiter and finer meat. The Cambridge turkey cock, April hatched, should make eighteen pounds for the Christmas market, the hen about two-thirds of that weight, both in their feathers. The bigger birds thirty pounds weight and over, are usually two-year-olds.

The American Bronze Turkey is the product of crossing by Transatlantic breeders between the best domesticated varieties and selected wild birds, and has been shown up to forty-five pounds weight and over.

The White Turkey runs rather small, but is pretty to look at, and choice flavoured in eating. The cock generally retains the hairy black tuft on his breast, and the red and blue on the head add to the attractiveness of the bird when alive.

Fancy Turkeys.—The Mexican turkey has white in his tail and covert feathers. The Honduras turkey is beautifully ocellated, bronzy green in ground colour, bounded with gold, lustrous black, and lower down with intense blue and brilliant red. He has no hairy tuft on the breast, and the lower part of his naked neck is smooth. This handsome bird seems only to flourish in tropical or sub-tropical regions. Crested turkeys have been known, but they were probably "sports" or freaks of nature.

Turkey Rearing.—Turkeys lay on an average from twenty to thirty eggs before wanting to sit, sometimes considerably more. The period of incubation is twenty-seven to twenty-eight days. For the

first few weeks of their lives young turkeys require unremitting care at the hands of the rearer, being most delicate and liable to cramp, and so stupid as not to be able to forage for themselves sufficiently. As they are mostly hatched under hens—six or seven is as many as can be covered properly—it is a good plan to put a few common fowls' eggs into the nest about the seventh day of incubation, so that the more active chickens, coming out at the same time as the turkey poults, may teach their foster brothers and sisters how to feed. The turkey is herself a good sitter and a capital mother, and she is generally given her last seven or eight eggs to incubate herself. The poults should be kept to a dry and sunny covered run, free from draughts and damp, which is death to them. Cleanliness must be observed in every particular, both as to feeding utensils—to prevent sourness in the food—and as to the state of the run and the coop or sleeping shed, the floor of which should be raked from the ground and covered with often-replenished dry soil or fine moss peat litter. Remember that on no account should the young turkeys get into the rain, and see that their feeding is regular and proper. Once an hour during daylight is not at first too often to feed the poults, just as much as they will clear up eagerly, and no more; and the diet needs to be judiciously varied. For four or five days custard of egg and milk, haribolled eggs, and minced dandelion leaves, or chopped boiled nettles, should only be given; afterwards groats, barley meal, with a mixing of boiled potato, and occasionally a little rice or other small grain, are good. To this must be added young lettuce or green onions, cut up small, or dandelions again. A little pepper with the food is often given for stimulating purposes. It will do the poults no harm to run about on a sunny short-shaven grass plot when they are a month old. About the third day, and again at six and eight weeks old when "shooting the red," are their most critical times, and at both these periods they require extra vigilance. Later they pick up strength wonderfully, and become exceedingly hardy, roosting out in the open in all weathers. The food of barley, tithing, meal, potatoes, turnips, and all kinds of food, especially if made into a mash with milk; they eat greedily when past the perils of poulthood, and glean most assiduously in the oat and barley stubbles after harvest. They want plenty of green meat, and some brick dust to scour their stomachs with, but they should never be given peas or any sort of pulse, for it is hurtful. Turkeys are killed for market by breaking their necks, the breast bone also being broken to plump them out,

PEA FOWLS.

Everybody knows the peacock and his almost indescribable beauty, his proud carriage, and his haughty air. He is a natural ornament of the lawn of many a mansion, walking, with muzzing gait and wondrous tail extended, over the greensward, or sunning himself on some picturesque terrace-wall or spreading tree branch. He comes from the gorgeous Orient, and has been acclimatised in Britain for hundreds of years. He has graced the banqueting board at many a royal feast, for his flesh makes fine eating. The domesticated pea fowl of this country is identical with the wild bird as found in India, China, and Ceylon to-day. The Japanese pea fowl inhabiting Burnah, Siam, and the Sumatra also, is of even glossier iridescence than the more generally known variety, and has a crest nearly twice as large; his hen, like that of his Indo-Chinese relatives, is very much soberer of plumage than himself, and also minus the noble ocellated tail. The black-winged or black-shouldered pea fowl would appear to be more of a "sport" than a distinct variety, and the white and pied specimens of the bird one occasionally sees are also "freaks," and not nearly so strikingly handsome as the typical species.

Management.—Pea fowls, once at maturity, seem pretty well able to manage themselves, given suitable surroundings; that is to say, a park to wander in at

will, and shade and shelter against climatic inclemency; and even these they prefer to discover and select.

The shrill screech of the cock when weather changes impend, or when he believes it will bring him a food donation, is scarcely claiming to the ear. The birds should be fed with regularity, which will keep them from flying far afield, and four to five females may be permitted to each male. The hens lay in a cunningly hidden nest, in some dense copse by preference, and sit well, if quite undisturbed, for the incubatory spell of four weeks; they are the very best of mothers, and lead about their little ones for fully six months. The feeding of the chicks should approximate to that proper for the young of the guinea fowl; but if there is a good range of short grass, and immunity from feline interference there will be no need to bother much about them after the first fortnight, for the fond mother will see to their every want. In the beginning the young cocks and hens are alike in appearance, the males not attaining any of their domestically distinctive beauty until eighteen months old, and not coming to full magnificence till the moult of the third year has passed. The pea fowl is a sorry sight during the moulting time, when he will mope and hide away, but it is soon over, and in his new bright plumage is proud enough to show himself again for admiration.

GUINEA FOWLS.

Varieties.—Three distinct sorts of the Guinea fowl are found in British collections, the speckled type from West Africa, called the Vulturine Royal Guinea Fowl, and met with wild also in an identical form in the Cape Verde Islands and the West Indies. It is sometimes called the Pearl Guinea Fowl, from the fancied resemblance of its spots to pearls. The body colour is grey, the neck hackled brownish-grey, horned on the top of the head, red-wattled, white under eye and on the ear lobes, slate-coloured legs. It carries the stern low, and has an arching back and tail in one long circular sweep. The white variety is wild in Madagascar, and the pied sort is said to be the result of a cross with the darker birds. There are blue and dun Guinea fowls, almost spotless, occasionally to be met with, and in some cases the colouring of the commoner kind is reversed, the ground hue being almost white and the speckling dark purple. The birds weigh about four pounds each, the male and the female being very much alike in appearance. Generally two hens run with one male bird, and the female has a very harsh call-note, like

the creaking of a greaseless axle. They are delicate eaters, and lay many cream-coloured eggs pointed at one end, hiding their nests when they have liberty.

Rearing.—Guinea fowls are of wild and wandering habit, and will find food for themselves if not penned and kept in the country, roosting in the trees at night. They are quarrelsome, and "drive" other birds, such as pheasants and game, remorselessly. Guinea fowls do not often themselves want to sit, so that their eggs are placed under ordinary hens, and take twenty-six to twenty-seven days to hatch out. The chicks are pretty little brown-bodied things, beautifully striped, with the legs and beak orange red. They have very small crops, and require feeding at first almost half-hourly, on ants' eggs and insects, ground oats, chopped egg, cooked meat, and chicken meal. It is quite as necessary to keep them free from damp as is the case with young turkeys, and the care in their rearing must be in no wise relaxed until the horn on the head is grown. Guinea fowls never do well closely confined; they must have range to be healthy.

PIGEONS AND PIGEON KEEPING.

Pigeon-keeping is a very interesting hobby, indulged in by many in town and country. As such it seems to demand some little attention here, though of course pigeons are not poultry, neither do they properly come within the category of Cage Birds, because usually they are permitted where and whenever possible by their owners to fly freely at liberty during at least some portion of the day, reliance being placed on the "lumping" proclivities of each pigeon to bring it back to its own cote, where it knows food and protection await it. This of course does not apply to the more highly bred and valuable exhibition varieties which are kept in aviaries.

Pigeon-Breeding is a hobby which appeals strongly to those fanciers who have not space at command to enable them to "go in" for poultry-rearing, but even pigeon-keeping may become both engrossing and costly if prized birds and champion flyers are "lunkered after." Before giving a few practical notes on poultry-keeping, we will briefly enumerate the leading

Pigeons and their Points.

Antwerp.—A strong big-bodied bird, in fact, the largest of our English fancy pigeons, excepting the Runt. It has a very stout beak and waxy skull, the preponderating colours are silver, dun, and red.

Archangel.—Rather uncommon; the head and breast copper coloured, wings, back, and tail rich, lustrous black or green, small crest, rich red eye.

Barb.—Small, slightly wattled, rich pink ceres round the eyes, came first from Barbary; the colours are black, white, yellow, red, and dun.

Blue Rock.—Common, good flier, containing many of the points of the wild originator of the domestic pigeon breed.

Carrier.—The "king of pigeons," abnormally developed as to beak, wattles, and eye ceres; rather larger than the ordinary pigeon. Colours principally black and dun, others white, blue, and pied. Head should be flat, narrow, long, and straight. Not the famous flier, but an exhibition bird entirely, and very costly, many having been sold at £500 each.

Cropper.—A variety of Pouter, smaller than the ordinary English Pouter, and differs in shape and feathering of legs. The Norwich Cropper has been much fancied by breeders in the city of Norwich, hence the name. The Cropper is smarter and more active than the Pouter. Colours: black, blue, white, yellow, red, dun, silver.

Doves are mainly indoor pets, and are dealt with in the Cage-bird section of this dictionary.

Dragon.—One of the wattled family, stouter and stronger in build than the Carrier, has a peg-shaped wattle, and its ceres are much smaller and finer than those of the Carrier. Colours: blue, blue-chequer, grizzle, silver, yellow, red, red-chequer, white, and mealy.

Fantail.—Sometimes called the Broad-tailed Shaker. Tail spread and erect, neck long and tapering, breast round and protuberant. Colours: white, blue, black, silver, red, yellow, and chequer.

Helmet.—Rare, white-bodied, coloured, helmet-shaped cap and coloured tail.

Homing Pigeon.—The "Carrier" of to-day—the bird most useful for long-distance flying races—has been bred up to perfection by fanciers in Belgium and elsewhere on the Continent, also in this country.

Homers, Show.—A large, strong variety which has been evolved by crossing the Antwerp with the Homing or Racing Pigeon. A very handsome and powerful-looking bird, with stout beak, long, gracefully-curved face and skull, dark ceres, and white eyes. Colours: black, blue, silver, yellow, red, dun, also chequers in these colours. The chequers produce the best show specimens.

Homers, Exhibition Flying.—Among the most popular varieties known to English breeders. It has been produced by the crossing of the Working Homer with the Show Homer, and is the latest creation in English Pigeon Circles. The chief points are stoutness of beak, length and levelness of face, which should take somewhat after that of the Magpie in shape, dark ceres, white eyes, smart, alert carriage, shortness of body and feather. The Exhibition Flying Homer is a very handsome Pigeon, and a decided acquisition to the previously known breeds.

Horsemans.—A cross-bred Carrier, rather less wattled, smaller and shorter in the neck, now scarce.

Jacobin receives its name from the frill of turned-back feathers running up the neck to the top of the head. Pretty and distinguished looking. A very popular and largely bred variety.

Laugher.—Now rare; in size resembles the common Flying Tumblers, generally grey mottled or red. Has a curious prolonged set of call notes broken with a sound like a little laugh.

Magpie.—Marked like the mischievous bird of that name; descended from a strain of German Tumblers. A smart, engaging bird, and one of the most largely

bred in England. Colours: black, red, yellow, blue, silver, dun, cream.

Modena.—An Italian breed which has secured great popularity amongst English breeders in the second decade of the twentieth century. It is a member of the family known as Hen Pigeons. The chief points are a short, round body, short wings and tail, the latter being cocked up and not carried down like that of most breeds. It is found in a great variety of colours, with most delicate and beautiful lacing, chequerings, and markings.

Nun.—Small in size; the body colour is white, the head, ten outer flight feathers, and the tail are coloured; at the back of the head there is a shell crest. Colours: black, red, yellow, dun.

Owl.—Small, round-headed, shy, rose-frilled after the fashion of the Turbit. Blue and silver the most esteemed colours.

Pouter.—A high-class bird with a globularly developed crop, should measure twenty inches from beak tip to tail end, stand very erect, and keep his tail off the ground. The English variety is said to be a cross between the Horseman and Cropper. Colours: blue, black, yellow, red, strawberry.

Rock.—The common pigeon generally provided for shooting matches.

Runt.—A bird of extreme antiquity, one of the oldest, as it is the largest breed; a pair of Runts will weigh from 4 lbs. to 5 lbs. They are ungainly, clumsy looking birds, and not much appreciated in this country. Colours principally blue and silver.

Shaker.—Another name for the Fantail; the narrow-tailed shaker is a half-bred Fantail.

Trumpeter.—Takes its name from its deep voiced note; is noisy in spring, or when highly fed. Feathered on feet and legs, has a shell crest at back of head, and a twin-crown arrangement on head, known as the rose. Colours: black, white, and mottled.

Tumbler.—Short and long-faced, fine fleshers, with a peculiar falling attitude at times on the wing. Short legged, wings drooping to the ground, neck squat, chest broad, head circular, eye central; Almond tumblers are much prized, the normal colour being that of the shell of the nut named, with black and white on the end of the quill feathers, and the body spangled with black. There are many colours and varieties. In self colours, red, yellow, black, white, silver. Birds which have a white mark under the beak, and bald-heads which have a white head are found in all colours mentioned. There are also chequers and blue-barred. In the Mottles and Rosewings there are blacks, reds,

and yellows. The Tumblers are again divided into Muffed and clean-legged.

Turbits have the breast feathers reversed and standing out full fashion. The best fetch fancy prices. Turbits have short beaks and small round fronted heads, with the top somewhat depressed, and a large eye. Colours: black, blue, yellow, red, dun, strawberry.

Pigeon-keeping Notes.—Pigeons are best kept in a dry and draught-proof loft—into which neither rats nor cats can get—with shelves ten inches broad or so running round the walls, and partitioned into compartments of, say, sixteen inches wide, with an entrance hole towards the end, over an alighting board. The water fountains should be replenished daily. The old birds must be properly fed with maple peas, tares, dari, wheat, and a little small maize. Some of the larger breeds need the addition of tick beans, especially the Homing Pigeons, while some of the smaller, such as Short-faced Tumblers, Orientals, and Foreign Owls, do not require maize, and few peas. They must be supplied with old mortar, gravel, and salt—or "salt cat"—and great cleanliness ought to be observed in the cote or loft. The pigeons will begin to breed at nine months old, and each pair will, if allowed, have six to eight nests (always two eggs at a time) during a year, and continue to breed for several years. Valuable pigeons should not be allowed to nest more than three times in the season. The period of incubation is 28 days, and the "squeakers" are fed at first by a secretion of the old birds called "soft food," and later with disengorged corn. The young cock birds are rather larger than the hens, and have a more prolonged squeak. A variation in dietary is good; the birds will eat any kind of corn and small beans, as well as peas, tares, and vetches. Lettuce, mustard and cress, small cabbages, etc., are suitable green food. Pigeons are apt to breed feather lice, which tobacco fumigation will clear away; white-washing and the free use of disinfectants will keep mites out of the nest-boxes and off the birds; while ticks may be dislodged by sulphuring. The birds are liable to a few ailments; wet rot should be combated by steeping green rue or mixing permanganate of potash in the drinking water; dry rot, which comes mostly at the moulting time, may be cured by two or three cloves of garlic sometimes; canker is often caused by the birds pecking each other, and the sore parts may be rubbed with honey and burnt alum; nigrims are incurable. In difficult moulting saffron may be given in the water to stimulate the birds; hemp seed is also beneficial at such times.

CAGE BIRDS.

British and Foreign.

It will be convenient in this section of the dictionary, to give in alphabetical order a few particulars of the principal kinds of birds, foreign as well as British, kept as cage-pets or in aviaries, indoor and outdoor, noting the leading points of the chief feathered favourites. These notes are supplemented by concise useful information concerning cages and their selection, the stocking of aviaries, the treatment of bird diseases, etc.

Bengalee.—Pretty fawn and white birds, much petted in Japan, and introduced as aviary subjects into this country by the dealers. Not much of singers, nest freely, but generally neglect or entirely desert their young.

Blackbirds.—Lively and bright, this familiar songster of our shrubberies and hedgerows takes kindly to a cage if hand-reared from the nest. He needs a good-sized wood-shell cage, and besides crushed hemp-seed and bread, rape and other seeds, should have a few worms, slugs, and insects given him as tit-bits, and a little ripe fruit occasionally. He will sing his thanks for these attentions, and his ebony feathers and crows beak and eye cere will be all the brighter for them.

Budgerigar. (See **PARAKEETS**.)

Bulbul. Oriental varieties of the Nightingale, useful aviary birds, very fond of ants' eggs and meal worms. Head, crest, and throat jet-black, rest of plumage chiefly olive-green, tail long and graceful,

must be protected from frost. The red-vented Bulbul is brown on back, tail, and wings, black on crest and top of head, red on vent, and red spot under eye; chin, throat, and ears white.

Bullfinch.—Black on head, rosy red-breasted, this familiar hard-beaked British finch is very much of a small cage or aviary favourite. Fed on German summer rape and canary seed, and occasionally, by way of a treat or change, give crushed hemp-seed; also give a tree branch to peck at for buds and insects. Bullfinches will pipe almost any time if patiently taught.

Buntings are all pretty aviary birds and the Yellow-hammer is the most familiar of the family. It requires insects as well as seed food to keep it in good health. The Girl Bunting is distinguished by a dark triangular patch on the throat; the Corn Bunting, a shy bird, is rather larger than the Yellow-hammer, greyer in colour, and speckled on the breast; the Black-headed Bunting, is black on the throat as well as the head. It is a winter visitor to Britain; so is the

Lapland Bunting a somewhat smaller bird, with the black marking reaching on to the breast. The Snow Bunting is mainly white, with some chestnut feathering; it dislikes heat, and prefers a stone to sit on to a perch.

Canaries are of many sorts, much hybridised and specialised by the fanciers. The bird came originally from the Canary Isles, where in the wild state it was not yellow as we generally know it, but a dark olive green. The deep yellow colouring, originally a sport, has been fixed by selection. The leading varieties are the Yorkshire, the Belgian, the London fancy, the Scotch fancy, the Norwich crest, the Norwich plain-head, the Lancashire, the Lizard, the Cinnamon, and the Border fancy, all of which have numerous well-defined sub-divisions. The canary has also been a great deal "crossed" with other birds of various breeds, the result being what is known as "mules," as the goldfinch mule, the linnet mule, the greenfinch mule, the siskin mule, and the bullfinch mule, all these, of course, being infertile. Of what are known as canaries proper there are several distinct classes of nearly every one of the leading varieties, the plain or self-coloured, and the variegated, each of which is again divided into yellows and buffs, or as the old used to style them jonques and meales. There is considerable diversity of size as well as of colour, shape and marking; thus the Copsy has been bred to eight inches long, while the little Border has been dwarfed down to nearly half that length. In different localities the fanciers fix their types of excellence according to their own ideals, and set up standards which "rule out" all the rest. The Yorkshires, whatever their colour shade, must be models of extended uprightness; in the Scotch, shoulders must be as heavy as possible, whilst the front of the bird must be cleaned out like a half circle or bent like a shag in tension; the Belgian must droop the head and shrug out the shoulders, the more the better; the Norwich is nearer the normal as to outline and build, high colour being aimed at by the breeder as much as nicely-rounded plumpness. Cinnamons are slightly less "stocky," fawn of hue and always red-eyed; the Lizard must be dark and dusky of body colour, capped and spangled, smallness with him is generally reckoned detrimental. The Lizards are styled golds and silvers, not yellows and buffs as are all the other breeds. Variegation, too, is the forte of the London fancy; and, as for the crested classes, everything with them is subordinated to "topping" development, even to the point of compelling the poor bird to look only downward upon its little world. Green canaries there are too; and every shade imaginable of yellow-self, from intense orange, eloquent of cayenne and marigold diet, down to the pale primrose of the buffs. Harking away again from simplicity, all the graded colourings, from the full rich jonque to the washed-out white, may be either mottled or splashed in contrasting darkness, clearly and without "running." So that the canary fancier can give "points," almost to infinity, to the feathered object of his hobby, even though he may incline to contemptuousness of the divergent choice of others. In addition to all these, which may be termed the show varieties, there are the German Rollers, so much esteemed for their song, which at one time were always called Harz Mountain Rollers, but now-a-days the best are not those from the Harz district. Choice Rollers are very valuable and may cost anything from 50s. to £10.

Cardinals are American birds, some of them as large as thrushes, rather sparrow-like in shape, big and strong of beak, pugnacious of habit, and often prettily feathered. The Cardinal Grosbeak, or Virginian Nightingale, is the gayest of the group, with a red with a black ring round the bill and a patch on the chin of the same hue. The Grey Cardinal, rather smaller, comes from Brazil, is slaty grey to white on the under parts, crest, head, and throat scarlet; the Green Cardinal is yellow and black, with a greenish sheen; the Pope is a little smaller, crestless, with the red feathering short and slight; and the Yellow-billed Cardinal is the least of the family, with a brownish-red head and a bright yellow beak. All make active and pretty aviary birds, and require some shelter in winter; food, chiefly

canary seed and millet, with ants' eggs, insects, and fruit.

Chaffinches are handsome little birds favoured in Germany as house pets. They sing and learn tricks well under patient teaching. Their food should be similar to that of the Canary, only giving more rape seed. In the moult they moult much and are very apt to pine and die. They brighten up an outdoor aviary much, and will nest if given the necessary accommodation.

Cockatiels are properly speaking parakeets, and though crested not at all allied to the cockatoo family, with which on that account some associate them. Cockatiels are grass or ground birds, with great swiftness and activity as a forager for food on foot. Seeds, insects, succulent roots, and small fruit, are the staple food. The cockatiel is a capital aviary subject where space is ample. It is grey and white, with a little yellow in the breast and on the face, dull red on the ear coverts, and black under the tail.

Cockatoos are amongst the most striking and attractive of the parrot race, most of them capable of a considerable amount of culture in the matter of tricks and talk, and generally gentle and graceful under domestication. The snowy-white lemon-crested Cockatoo from Australia is a prime favourite; the rosy-breasted, triple-crested Leadbeater's Cockatoo is particularly handsome; the Great Salmon Cockatoo from the Moluccas is also mainly white, with a pearl-bloom tinge on the front, a broad backward inclining crest, and puffy, loose feathering; the bare-eyed Cockatoo of Western Australia, spare of crest, red-throated, is about the best of talkers of a numerous loquacious family. The Antipodean Rose Cockatoo is occasionally mistaken for the Grey African Parrot, but his white head and small crest should save him from being so confounded, though the latter lies flat when the bird is not excited, and he has his bit of red colour on the breast and not on the tail; the slender-billed Cockatoos have the upper mandible curved forbiddingly and lengthily over the lower, but are very tractable birds of all that. There is a Goliath Cockatoo, big of beak, and sooty feathered, which comes from New Guinea; some "all blacks"—forming a kind of link between macaw and cockatoo—rather scarce Australian birds; and a number of pretty sulphurous to ochre-crested white cockatoos from the Carolinas and Philippines, all small and black-beaked.

Dippers are shy stream-waders and mainly water-feeders, as big as blackbirds, save for the shortness of the tail. Slate grey on the back, white breasted, browner below, tripping of gait, can swim well, using their wings as fins. Only fit for a large aviary, with a little stream and secluded nooks in it.

Doves are gentle, engaging little pets, and will, most of them, breed in suitable wicker cages or aviaries if themselves hand-reared. The Turtle Doves are prime favourites, but the Ring Dove or common Wood-pigeon, the Stock Dove, and the Rock-pigeon are all kept in cages, or aviary compounds, with success. Our Turtle Doves will interbreed with the Barbary Doves or the larger Egyptian Turtle Dove. Those with plenty of aviary room may keep some of the other very pretty foreign doves which the dealers have specimens of at times, such as the Long-tailed Masked Dove from the Cape, sometimes called the Harlequin; the crested Goura of the Philippines, the Nicobar Pigeon, the Bronze Wing, the delicate Diamond Dove, the plump little Zebra Dove, the glistening Green-winged Dove, both from the gorgeous Orient; the charming Tambourine Dove, chocolate above and white below; and the pink-eyed pure white Java Dove. All the latter must be kept warm and given room to exercise their wings to be a success. Canary and millet seed, with darts and soft oats, suit the smaller doves, the larger may have any good corn peas, vetches, and buckwheat as well.

Finches of all kinds, foreign as well as British, make admirable aviary birds, and most of them will nest under confinement. Chiefly seed-eaters, they are all, more or less, fond of millet and canary seed, and like ants' eggs and meal worms, girdles, etc., especially when rearing young. The Green and Grey Singing Finches are great favourites with many bird lovers, the

former being sometimes styled the Cape Canary. The tropical and sub-tropical finches are, of course, suited only for indoor aviaries, at least in the winter time. Some of them cost a lot of money.

Flycatchers are shy but restless little birds, not unlike tits in action, but longer tailed. They need either a large cage or an aviary to do well, and must have as much insect food as possible, mealworms, ants' eggs, etc. The Pied Flycatcher is the commonest, the Spotted Flycatcher and the Red-breasted Flycatcher—the latter being a little Robin—are also sometimes seen in confinement.

Greenfinches are pretty birds, but poor singers. They have powerful pointed beaks, and a patch of bright yellow on the wing. Ordinary bird-seed will do for this hardy finch.

Goldfinches, or Redcaps, as some people prefer to call them, are the most beautiful of British birds, besides being fine songsters. At first—and until the moult—the young birds are grey feathered on the head. Their rape-seed should be scalded, and any hemp seed given them ought to be crushed; thistle and teazle-seed should also be given them. Goldfinches are very fond of green-stuff, but it is important that it should be fresh, and their drinking water should come from a pond or well.

Jackdaws are the smallest of our crows and not the least mischievous. The bird is generally allowed to ramble at large during the day time, leaving half a dozen wing feathers clipped to keep him from flying right away. The male has more crest and more grey on the head than the hen. They can be taught a lot of tricks and seem to know many intuitively. Jackdaws are omnivorous and will take anything from the table; but they ought to have a dead mouse occasionally as a treat to keep them in condition.

Jays must be kept to themselves, or there will be murder in the aviary; a big basket cage is best for them. They are beautiful birds, with a lot of blue about them, and very bold. The cocks can be taught to talk. They are fond of peas and beans, worms and insects generally; and must have a certain proportion of animal food of some sort.

Keas are the Parrots of New Zealand, and though by nature mainly herbivorous, enjoying a varied diet of roots, berries, and such food, they have contracted a taste for kidney fat, and indulge it to such an extent that they have become wanton sheep-killers in the eagerness to procure this dainty fare.

Kingfishers are bright and beautiful birds, and require a large aviary with running water and living fish in it for their food, and convenience for seclusion. They take very badly to confinement, and are so dirty in their habits as to be quite unsuited to any sort of imprisonment. The Halcyon of the ancients, the Kingfisher is altogether out of place in a cage.

Larks will strive to soar whenever they wish to sing, so that a soft cloth or balize top must be provided for their cage, also a fresh turf for them to peck at. They do much better in a large cage than in a small one, with plenty of room to run about, and road-dust to roll in. Larks require insect food as well as seed.

Manakins are Central American birds about as big as our thrushes. The Bronze-Spotted and Golden-Winged species are mainly black and white, with very shaggy shoulders. They live in the damp depths of the forests of Brazil and Guiana, and feed on seeds and insects. Sometimes will breed in a large and warm aviary or bird room. The voice is inharmonious.

Mocking Birds are American thrushes, long of tail, grey and white in colour, and not such fine singers as they are generally reputed to be. They may be treated in captivity like our own thrushes, and should have a little insect food in variety.

Nightingales do not sing in cages so well as in the woods or shrubberies, which they make melodious with their summer warbling by day as well as night. They are readily hand-reared when taken from the rather slovenly nest and fed on ants' eggs, mealworms, gentles, and almost any insects. Very small red garden worms, not over an inch long, and cut in two, may be given to them; but being migrants, they are difficult to retain in captivity for any length of time in

this country. Matchless in song they are soberly clad, brown-tinted above and grey below.

Nuns are Asiatic and African finches with white or black heads, and should be treated as other foreign birds of the same character, whether kept in small cages or as aviary specimens.

Nutmeg Birds, sometimes called Spice Birds, may be reckoned relatives of the Nuns, and need similar treatment in captivity. They are chocolate coloured above and brown speckled on white beneath. **Finches** are sweet singers, and should in captivity be accommodated with larger cages than the tiny cramping wired boxes usually provided for them. Grey, brown, or speckled feathers are worn at different periods by these birds, and the cocks have a rosy breast tint autumnally when at liberty. Small seeds are their only necessary food. They interbreed with the canary, the linnet mule being a very fine songster.

Love Birds are most interesting pets, pretty of way as well as pretty of feather. Miller is the best seed staple, white or spray, and they will most of them eat cooked maize, ants' eggs, and sweet sponge cake. The so-called Abyssinian Love Birds are green and yellow with black markings and red bills, surrounded by a broad band of orange. They really come from the West Coast of Africa, and must be kept warm and out of all draughts. The Rosy-faced Love Birds are rather larger, and have the mask on the face of a pretty peach shade, and the bill white. They will breed in confinement sometimes if given a cocoa nut husk to nest in.

Magpies are chattering and destructive Pies, and should either have restricted liberty or a large cage. They will eat anything, and are restless lumps of mischief. The common British Magpie is in the spring-time velvety-black, relieved by pure white on wings and breast.

Parakeets are magnificent birds, many of them. Much smaller than the macaws, they have long tapering tails like them, but feathers on the cheeks instead of bare skin. There is an intermediate group, with partially-feathered cheeks, called macaw parakeets. Parakeets are gentle, vivacious, and apt at talking. They are found in the forests of every part of the world save Europe, and their plumage is chiefly green, with markings of red or blue. Perhaps the Rosella Parakeet of New South Wales is the most beautiful and brilliant of any, though the King Parakeet, the Tippet of the Antipodean Broad-tails, is another particularly gorgeous bird. Of the smaller parakeets, none is more striking than the Auniceps, or Golden-headed parakeet of New Zealand. It is only 8½ inches long when full grown, and half of that is tail. The forehead is scarlet, with a band of golden-yellow behind. Most of the rest of the feathering is green, with some blue and yellowish-grey. Maize, either cooked or raw, hemp-seed, nuts, fruit, biscuit can be fed to parakeets and all the parrot tribe, and they should be offered clean water to drink two or three times a day.

Parrots are a large family, and properly speaking, do not include the long-tailed macaws or the gorgeous lorikeets and lorikeets, nor the parakeets, cockatoos, and cockatiels already treated. All of them require protection from cold, and cages or perches, which may be placed out of doors in the summer. The dietary has been indicated sufficiently, save that the lorikees need boiled rice, sweetened with honey. They want water to bathe in, and must be kept out of draughts. Sop is not a bad thing for parrots for a change, but they ought not to be given meat. Chickweed and ripe corn in the ear are enjoyed by most of these birds. Some will live to a great age in captivity. Perhaps the Grey Parrot from the African West Coast is the greatest favourite, but the Green Amazon is favoured by some. Their beaks are very powerful. The aras or macaws come from Brazil and other parts of South America.

Ravens are quick, sagacious birds, full of fun and frolic, and quick to learn any kind of talk. They want a lot to eat and plenty of room. What they can't eat they'll hide. The hen is larger than her male, but not so glossy black. They like tasty food, and will destroy anything for mischief's sake, even to eating white lead and staircases, as Dickens's used to do.

Redpolls are very like linnets, except as to size, being a little smaller. They come to Britain to winter, and tame readily, breeding late. The young may be hand-reared on bread and milk, or a paste of buck-wheat flour. The red on the poll and breast will not long remain under captivity, either in cage or aviary.

Shrikes are Indian birds of robin-like habit, ten inches long. They are good aviary birds, of very handsome black-blue, and rich brown plumage, and may be fed as recommended for the nightingales.

Shrikes are the smallest of British birds of prey, and must, of course, have insects and flesh food, such as small mice, or pieces of rabbit with the fur adherent. In an aviary they must be kept away from the young of other birds, or they will certainly destroy the nestlings. The Red-backed Shrike, or Butcher Bird, is rather a fine-looking fellow; the Great Grey Shrike is more of a rarity, and the Lesser Shrike and the Woodchat are not often seen in collections.

Siskins are yellow-green to greenish-grey, with black on the head and throat of the male. They mate with the canary, and are very docile, requiring similar feeding to that bird or the linnets and other finches.

Starlings are capital talkers at times, and good aviary birds, with a quaint way of walking when foraging for food. They eat many insects, and are fond of berries and soft, ripe fruit. In the springtime they are very beautiful when the sun glints on their lustrous plumage.

Tangars are American fruit-eating birds who like a few insects occasionally, but prefer grapes, ripe pears, bananas, oranges, and summer fruit generally. Sometimes they live solitarily, sometimes in flocks, the Grosbeak Tanager building quite a little bird town in the top of a palm tree for the accommodation of a large family group. The Scarlet Tanager is the brightest of the Tanager species.

Thrushes require similar feeding and accommodation to their Blackbird relatives. They will sing very sweetly in a cage, and are fond of sunflower seeds and fat white slugs or shell snails.

Tits are most interesting aviary birds, their quaint nest building and peculiar way of turning topsy-turvy in searching crannies of bark for insect food being most diverting. The Great Tit is black on the head; the Blue Titmouse is half his size; the Coal Tit has white cheeks and a grey back; the Crested Tit is a rare Scottish bird with a tuft on its head; the Marsh Tit is darker than the Coal Tit except for the absence of the black patch on the throat; the Long Tailed or Bottle Tit hangs up its wonderful mossy nest to a tree branch; the Bearded Tit is now very rare. All must have ants' eggs or insect food of some sort, and they prefer to find it for themselves.

Wagtails are restless waders, some call them "Feggy Dishwater" because of their quaint habits. They are insect eaters in the main, all the varieties, and they should never be caged, but kept in aviaries with a running stream and a grass plot.

Warblers are a numerous family, headed by the Nightingale, already noticed, and including the Blackcap, Dartford Warbler, the White Throats, the Wrens, and the Chiffchaff. In captivity they must have ants' eggs or similar food.

Weaver Birds are little African species varying from sparrow to starling size, and very good aviary birds, especially when they can be induced to do their wonderful nest making either for pastime or nidification. They are a numerous family of many colours, as some of their names sufficiently indicate, and all will eat millet and canary seed.

Whydah Birds are long-tailed, hard-billed, seed-eating birds about as big as Canaries, and coming from Senegal, and South Africa. The peculiarity is the disproportionately long tail which the male develops

at the breeding season. They change their plumage twice a year, and the Paradise Whydah has tail feathers thirteen to fourteen inches long, without being the most liberally endowed of the family. They want millet and other soft seeds as a staple, with some insect food or ants' eggs.

Aviaries and Aviary-stocking.—Aviaries may be indoor and outdoor affairs, simple and inexpensive, or ornate and costly, according to the taste and the means of the bird-fancier. They may be part of a conservatory partitioned off, with hanging and other plants in it, and capable of being heated to suit the needs of tropical and sub-tropical birds. In that case there should be ample accommodation for the numbers and species included, and a proper sorting of the birds without overcrowding. Ventilation should be perfectly arranged for, and great attention given to cleanliness, for strange bright birds otherwise would soon become bedraggled and miserable looking. A good deal can be done in a bird room with exotic feathered favourites by an ingenious handy man; but the hobby is rather an expensive one if the fancier has to go often to the dealers. It is well not to attempt too much, and a study of the foregoing paragraphs will be found helpful if the natures of the various birds and their habitat be borne in mind. As regards the harder British birds, most of them are suitable for keeping in an outdoor aviary of sufficient dimensions. It should be about fifteen feet high, zinc-roofed, and properly guttered, opened to the south with a wired front and glazed sides, and a stout back of brick or woodwork, all well-constructed. The perches and trees, nesting accommodation, etc., should be as close a following of Nature as possible at all points, and there must be proper cover and seclusion and the necessary water supply.

Cages.—Blackbirds, thrushes, and such birds should be placed in roomy cages, with a draw-out floor for cleaning, boarded back, and covered food and water vessels; larks require a board front to take fresh turves, and a sort of top to the cage; canaries and the finches generally may have all-wire cages, or wire with japanned metal top or back, in the shapes known as Chinese, Gothic, Cottage or Arched. Glass part of the way up conduces to cleanliness.

Bird Diseases and Bird Medicine.—Pip is the commonest of bird ailments, being of the nature of a cold. A pill of butter or pepper will sometimes do good. Epilepsy arises usually from over-feeding; olive oil may afford relief, or plunging in very cold water. Moulting time requires very careful feeding, extra cleanliness, and perfect freedom from draught, with a little iron infusion in the drinking water. Saffron is good for costiveness, especially if given with linseed oil, and for catarrh speed-well infusion and some pectoral elixir may be recommended. Giddiness may be prevented by covering the cage-top with a cloth in many cases. Feather eating is most frequent where the confinement is close and the cage small; room for flight will generally cure it. Over-stimulating food will make any bird ill, and very likely kill it in the end; let not this error of dietary be perpetrated by any bird-lover. Asthma comes of letting a bird, accustomed to artificial heat, get into a draught; many cage-birds are ruined thus. Generally speaking, a bird hanging in a window is in a draught. We are no advocates for bird coddling, but keeping your pet out of currents is most essential. If your cages and perches are quite clean always, and you keep the claws of your birds mostly cut, there will be little fear of sore feet. Camphor water, weak, is good for washing the feathers of birds suspected of harbouring red mite, and a good insecticide may be used at the nesting period with advantage. Fir-tree oil is recommended. The higher the cage is hung in a room the worse the air for the bird.

PEARS'
DIGTIONARY
of COOKERY.

EDITED BY

A. BEATY-POWNELL.

Pears' Dictionary of Cookery

INTRODUCTION.

By A. BEATY-POWNELL

(*Editor of the Cuisine and Le Ménage Department of "The Queen"*).

When "wild in woods the savage ran," the art of cookery was not much better understood than the art of painting; but as civilisation advanced the sense of taste developed as well as our other senses (as Nature intended), and the cook came into existence. So, from century to century, the art of cookery has progressed, and at the present day has attained a degree of perfection unknown in any previous age.

But cookery is an art of many branches; and it may be on expensive or on economical lines. There are people who imagine that good cookery is mainly a matter of cost; but this is a mistake. Good, sound, healthy cookery comes as much within the scope and duty of people of moderate purses as of the rich. Beyond a certain limit, cookery loses itself in those higher reaches of delicate refinements that may properly be left to *gourmets* of leisure, taste, and means.

This Dictionary of Cookery aims at being a practical, serviceable guide to good cookery, adapted for the ordinary household.

Everyone knows the difference between a meal, simple in itself in the extreme, and yet nicely served, and the same meal served anyhow, and it is the aim of this Dictionary of Cookery to show how this may be done.

English cookery has long been a term of reproach, but this at last, owing to the strenuous efforts of men and women who are authorities on their special subjects, is fast becoming a thing of the past.

For some time now the meals of those who have not to consider expense have been served with a view to obtaining the best results in the simplest manner, and yet with absolute perfection. All fashions filter down, and luckily this one has proved no exception to the rule. Little as it may be imagined, in years long gone by English cookery held a really high position in the culinary world, and English cooks were justly famed, and there is every prospect, with the increased advantages at people's disposal, that this may once more become the case.

The great secret of success in cooking lies in making the best of the materials at our disposal, and this applies equally to every class. It is gradually being borne in on us that there is no reason to limit ourselves to the eternal round of joint, whether beef or mutton, varied occasionally by a chop or beef steak. Everyone should aim at giving variety, and the directions that follow are such that any one with a good will may follow them.

Every woman should make a point of grasping the fundamental principles of roasting, boiling, and frying, and last, but by no means least, should understand the proper way of making the simple sauces, for there is the greatest difference between melted butter, for instance (the sauce that is perhaps the most commonly used), properly made, and the ghastly paste-like substance which usually is served in many households.

The following recipes are intended for the average household, but offer a number of ways of serving the most ordinary food, and yet are within the means of most homes. They are alphabetically arranged for greater convenience, and are given in the simplest possible terms.

Much of the happiness of the home depends upon the manner in which the daily meals are cooked and served. Where the cooking is bad, it is wasteful; where it is good, not only is economy served, but health; and by varying the menu from day to day, however homely the range of fare may be, the palate is ministered to, the appetite is strengthened, and every day becomes more or less a day of good cheer. A sense of comfort and gladness always accompanies

the serving of a dainty meal; and in the following pages will be found an adequate round of suggestions for satisfying all reasonable culinary tastes and requirements, without involving unnecessary cost.

Before proceeding to give a selection of approved recipes for various dishes, savoury and sweet, covering the whole range of cookery—poultry, fish, meat, vegetables, fruit, pastry, and confectionery, as also pies and puddings of many kinds—suited to the table of an ordinary house hold, we propose to devote two short introductory sections to useful notes and hints on the kitchen and cookery generally. The opening section deals with kitchen work, kitchen utensils, and the care of the larder, and each paragraph, complete in itself, is sequential in a way to what has preceded it. This is followed by the section in which numerous homely, but important, Cookery Hints are similarly arranged; after which, in alphabetical order, under a sectional system of entry, with cross-references to prevent repetition and facilitate consultation, come the culinary recipes, all given in the plainest possible language.

KITCHEN NOTES.

Beef Choosing.—When beef is chosen see that it is of a bright red colour, and the fat a rich yellow. Should a sirloin be purchased, see that it has the undercut, if you are able to cook filets of beef; they are quite delicious, and make a sirloin a two-days' hot dish. The filets should be served the first day, as they are taken from the undercut, and the next day you have the sirloin ready to roast.

Beef, to keep Sweet.—To one gallon of water add one and a half pounds of coarse salt, half a pound of brown sugar, half an ounce of pearl ash, and half an ounce of saltpetre; mix and heat to boiling point, and skim well; let cool, then pour over the meat.

Butter.—To test whether a suspected compound is butter or oleomargarine, melt it, immerse in it a bit of cotton wick, and set the tip alight. Butter burns with a dainty and agreeable odour, while oleomargarine has an unpleasant smell.

Butter, to keep Firm.—In hot weather, fill a large basin with cold water, put as much kitchen salt in as the water will dissolve, fold butter in grease-proof paper, and drop it in. Stand basin in the coolest corner of larder.

Cakes, to keep Nice.—Have large cake boxes, or a stone jar, and cover closely with a tight-fitting lid.

Cheese, to prevent Mould in.—Rub the cur part with butter, and cover with white paper.

Coffee and Teapots.—To be kept sweet, should be scalded after using every time; also, occasionally throw into them a cupful of wood ashes or some powdered borax; fill with cold water, and bring slowly to a boil.

Eggs, Buying and Testing.—In buying eggs, a clean rough shell is to be preferred to one that is smooth and sticky. The most certain test is to put them one at a time into a basin of cold water. A new-laid egg will sink like a stone; an egg that has been laid a few days will rise a little at the largest end, and in proportion as they become actually stale, will assume nearly an erect posture in the water; an egg that floats is infallibly very bad.

Fish Choosing.—Any fish that is broad and thick of its kind is to be preferred to those that are thin and narrow. See also that the eyes are bright, the gills red, the scales closely laid and shining, and that the fish feels stiff. Stale fish has always a lumpy feel, especially about the vent; the eyes become filmy, the scales brown and flabby, and the whole presents a dingy appearance.

Fish, to keep.—If fish is found to be slightly tainted, a good thing is to steep it for a short time in a weak solution of permanganate of potash or boric acid, which destroys the tainted particles, and leaves the fish perfectly sweet and wholesome.

Food of any kind must not be suffered to become cold in any metal utensil; even tin or iron, however clean, give an unpleasant flavour.

Food, keeping Warm.—When it is necessary to keep a meal warm for a late comer, place the plate or

dish in a steamer, over a pan of boiling water, protecting with a cover that will just sit over the edge.

Glasses in which milk has been served should be plunged into cold water before they go into warm water. Egg-spoons and cups should be treated similarly. Egg stains can be removed from spoons by rubbing with a little salt.

Kitchen tables and shelves may be kept very white and clean if you have this mixture used for scouring them with. Half-pound sand, half-pound lime. Work the dissolved soap into the dry ingredients. Put the mixture on with a scrubbing brush, and wash off with plenty of cold water. Lemon-juice well rubbed into kitchen tables quickly removes all grease.

Knife cleaning may be facilitated by taking a strip of old carpet, tack it tightly on the knife-board, and sprinkle with scab brick. This will produce a good polish without scratching the knife.

Meat may be kept good in summer by lightly covering it with bran, and hanging it in some dry cellar.

Meat safes should always be put in an airy place, and if possible where a draught may blow through. It should be emptied daily in summer and wiped with a clean wet cloth. Keep a dish of charcoal standing in the larder.

Pans of all kinds should be cleaned and put away directly after use. If this should on occasion be impossible, fill the pan immediately with hot water and soda, to prevent the grease getting hard and caked. Saucepans should always be washed inside and out, and in these days, when one rarely meets with an open fire, it is easily done. A pan that is rusty, or even a little dirty, will prevent soup which is cooked in it from being clear. Every cook should be provided with a saucepan brush, and armed with this, and a little soap and soda, she will scour the insides and outsides of her pans till they shine like new.

Poultry, Preparing for Table.—If obliged to dress poultry immediately after killing, steep in boiling water, and feather while in the water. This method will make it as tender as if killed some days previously. To prevent drying, and to improve the bird, tie a slice of raw bacon over the breast when roasting. By rubbing the breast of a fowl with lemon juice before boiling, you will be able to send it to table with a snow-white appearance.

Spoons of wood are far superior to metal ones for cooking work. Fruit which is being stewed or cooked in any way should never be stirred with an ordinary metal spoon.

Stains on baking dishes can be easily removed by dipping a piece of flannel in whitening, and rubbing it well into the stain.

Tea and Coffee should be kept in glass jars rather than tin canisters.

Wine, to Cool.—To cool a bottle of wine without ice, wrap a flannel wetted in cold running tap-water round the bottle.

COOKERY HINTS.

Culinary Terms.—The following are culinary terms often met with but not always understood:—

Aspic.—Savoury jelly for cold dishes.
As gratin.—Dishes prepared with sauce and crumbs and baked.

Baba.—A peculiar sweet French yeast-cake.
Bechamel.—A rich, white sauce, made with stock.
Bisque.—A *purée* made of shell-fish.

Blanch, To.—To place any article on the fire till it boils, then plunge it in cold water; to whiten poultry, vegetables, etc. To remove the skin by immersing in boiling water.

Bouchées.—Very tiny patties or cakes, as the name indicates, mouthfuls.

Bouillon.—A clear soup, stronger than broth, yet not so strong as *consommé*, which is "reduced" soup.

Braise.—Meat cooked in a closely-covered stewpan, so that it retains its own flavour, and those of the vegetables and flavourings put with it.

Brioche.—A very rich, unsweetened French cake, made with yeast.

Canneton.—Stuffed, rolled-up meat.

Consommé.—Clear soup or *bouillon* boiled down till very rich, *i.e.*, consumed.

Croquettes.—A very savoury mince of fish or fowl, made with sauce into shapes, and fried.

Croustades.—Fried forms of bread to serve minced or other meats upon.

Entrée.—A small dish, usually served between the courses at dinner.

Fondant.—Sugar boiled and beaten to a creamy paste.

Fondue.—A light preparation of melted cheese.

Marinade.—A liquor of spices, vinegar, etc., in which fish or meats are steeped before cooking.

Matalote.—A rich fish stew with wine.

Mayonnaise.—A cold sauce or dressing, chiefly for serving with salads.

Meringue.—Sugar and white of egg beaten to sauce.

Mireton.—Cold meats warmed in various ways, and dished in circular form.

Purée.—This name is given to very thick soups, the ingredients for thickening which have been rubbed through a sieve.

Rémoulade.—A salad dressing, differing from mayonnaise in that the eggs are hard boiled and rubbed in a mortar with mustard, herbs, etc.

Soufflé.—A very light pudding, steamed or baked.

Trifle.—A sweet made from sponge cakes, macaroons, etc., with jams, wine, or liqueurs.

Vol-au-vent.—Minced meat, in light puff paste, cut oval or round.

Cooking by Gas.—Joints cooked in a gas stove sometimes have a grassy taste because they are placed in the oven before the stove is lighted. You should always see that your oven has fully ten minutes to get warm, when the gas is only half-turned on. Open the door for the first few minutes that the air within the oven may free itself of gas. When this has been done, close the door, turn the gas full on. These remarks also apply to bread.

The Stock-pot.—This is an important thing in cookery. Put whatever bones you may have into a pan kept for the purpose (previously breaking them in pieces), boil them for three or four hours at least, then pour off the liquor into the stock-pot, and add to each gallon the meat off a knuckle of veal, a pound of lean beef, and a pound of the lean of a gammon of bacon, all sliced, with two or three scraped carrots, two onions, two turnips, two heads of celery sliced, and two quarts of water. Stew the meat quite tender, but do not let it burn. When thus prepared it will serve either for soup, or brown or white gravy.

Clarifying Dripping.—To clarify beef or mutton dripping, put into a basin pour over it boiling water, and keep stirring the whole to wash away the impurities. Let it stand to cool, when the water and dirty sediment will settle at the bottom of the basin,

Oven, Testing the Heat of.—Place a piece of white paper in the oven, and if the heat be too great it will blacken or burn; if it only turns a light brown colour it is fit for pastry. If the paper turns a dark yellow shade, the oven will be right for baking the heavier kinds of cake; if a light yellow, then it is fit for sponge cakes and the lighter kinds of biscuits.

A tea-cupful of flour equals four ounces.

Tomatoes, to Slice.—Put them for a few minutes into boiling water; they will then peel easily and cut without waste, and in no way spoil the flavour.

Beetroot, to Peel.—When the beetroot is thoroughly cooked, take it out of the saucepan and hold it in your hand with a clean cloth; then, with the other hand, gently draw the skin off. This leaves the beet smooth without waste. It must be done when hot.

Onions, Peeling.—To remove the smell of onions, rub the hands after peeling them on a stick of celery, and the odour will be entirely removed.

Candied Peel should always be placed in the oven before cutting up.

Raisins will stone quite readily if warmed before stoning them.

Currants and Raisins.—To clean raisins and currants, roll in flour, and then pick off all large stalks. If currants are washed, they must be dried before being added to cakes.

Taploca, Cooking.—Before cooking taploca for a pudding, soak it in water until it is swollen, and allow a pint-and-a-half of milk to every ounce of taploca—weighed before soaking.

Dishing and Garnishing.—Dishes which are served hot do not permit of as much garnishing as cold ones. Proper attention should always be given to the cutting and trimming of meats, the moulding of croquettes, meat-balls, or anything served in pieces, and also to the dishing of the same. The garnishes for meat dishes are so various that it might be said their only limit is the resourcefulness of the cook.

Flour, Browning.—Have always handy a jar of browned flour for colouring gravies, soups, etc. To prepare this, place a quart of flour at a time in a dripping-tin, in a moderate oven, and stir it about at intervals till brown. Keep the jar well covered.

Cream Substitute for.—Stir a dessertspoonful of flour into a pint of new milk, taking care that it is perfectly smooth. Simmer it to take off the raw taste of the flour. Beat well the yoke of an egg, and stir it gently into the milk. Pass all through a fine sieve.

Butter, to Cut Clean.—When cutting butter from a large roll in very cold weather, first dip the knife into boiling or very hot water, when all trouble of breaking the butter will be obviated.

Cake, Testing a.—A sure way of telling if a cake is well baked is to lightly insert a skewer in the centre, and if clean when withdrawn the cake is perfectly cooked. To find out whether there is any alum in cakes or loaves, heat a knife and thrust it in. Any alum will partially cover the knife.

Chop, Cooking a.—Pour boiling water over the chop, when it has been placed in a colander, in order to close up the tissues and enable the chop to retain the nutritive juices. Grill over a clear, hot fire, and turn carefully so as not to prick it in any way.

Boiling.—When boiling meat, keep the lid of the stewpan down tightly. When boiling dumplings, keep the lid of the saucepan raised. If this is done, the dumplings will never be heavy; that is, if the water is kept boiling the whole time. Boiled puddings should be plunged at once into boiling water, and should boil fast, not simmer.

Steaming Steak and Kidney Puddings is better than boiling them. They are far lighter and more digestible; but allow double the time for cooking, or they will not be done.

Broiling.—To broil meat or fish, the fire should be quite clear. Set the gridiron over the fire to get hot, while a lump of butter or nice sweet dripping is melting on a plate in front of the fire. Well wash the fish

or meat, whichever you wish to broil, under the tap. Never put any but salt fish to soak. Dry the fish on a clean cloth; lightly sprinkle with salt and pepper.

Carving Fish.—The implements generally used for carving boiled or braised fish are either a silver fish-slice, spoon, or fork. If a long-shaped fish is to be carved, such as bass, salmon, &c., trace first a line along the backbone, beginning at the head and finishing at the tail; then cut the fish into slices, and lay each piece on a separate plate.

Apple Jelly.—Simple. Put into a pan 2 oz. of best leaf gelatine with a quart of hot water, a dessert-spoonful of salt, the juice of a lemon, 3 bay leaf, a teaspoonful of good brown vinegar, a tablespoonful of tarragon vinegar, a small onion sliced, 5 mixed peppercorns and allspice, and the whites and shells of 5 eggs. Let this all boil up, and then run it through a jelly-bag wrung out in hot water.

Bacon Kromesekies.—Cut some very thin slices of streaky bacon about one and a half inches broad by two inches long. Lay each slice flat, and place a little nicely-seasoned minced meat on each. Roll up the bacon tightly, taking care that the meat does not escape, and put aside in a cool place. Prepare the frying batter and let it stand for two hours. To serve, dip each roll into the batter, plunge into deep boiling fat and fry a golden colour. Garnish with parsley.

Bacon, Macaroni and Tomato.—Take half a pound of bacon, half a pound of macaroni, six tomatoes, grated cheese, butter, pepper and salt. Boil the macaroni in salted water till tender, then drain and cut it in short lengths; fill a buttered baking dish with alternate layers of macaroni and tomatoes, flavouring each layer with grated cheese, pepper and salt, and putting small pieces of butter between them; cover the top with fine breadcrumbs and bacon cut in dice; bake in a moderate oven and serve hot.

Bacon and Tomatoes.—Peel a pound of ripe tomatoes, and cut them into a stewpan with one-third their bulk in fine breadcrumbs, a seasoning of salt, pepper, lemon juice and minced parsley, three ounces of fresh butter, and a teaspoonful of very finely chopped onion, and stew over a gentle fire from fifteen to twenty minutes; then have ready some daintily fried pieces of stale bread, half inch thick and two and a half inches in diameter, which have been fried a golden brown in boiling clarified fat, and well drained in order to render them quite crisp and dry—and arrange these neatly on a very hot dish; pour the stewed tomatoes over these, garnish round the edge with small slices of prime bacon, cut thin, and toasted or fried, and dish up very hot.

Beef, Chooching. (See "Kitchen Notes," Introductory.)

Beef, à la Mode.—Melt two ounces of beef dripping in a stewpan; fasten two pounds of steak in a nice shape, flour it and fry it a nice brown on both sides. Pour in good stock to barely cover the beef; add a dozen or so of mushrooms, peeled and cut in halves. Simmer gently for three hours, when the meat will be quite tender. Serve on a hot dish, with the mushrooms round it.

Beef, Boiled.—Salt the aitch-bone joint or brisket for about four days. Cover with water in a saucepan and boil. Quick boiling will make it tough. Remove all scum, and add, to boil until soft, some turnips and carrots. Also dumplings, if liked.

Beef, Boiled, Round of.—Take about eight to ten pounds of the silver-side of beef, and salt for nine or ten days. Skewer up into a round, bring to the boil with sufficient water to cover, and then very slowly simmer until tender.

Beef, Brisket of (Baked).—The joint is very appetising, stuffed and breaded, and very cheap too, which is an object in most households. Take out the bones, and fill the holes up with good stuffing, of whatever sort is liked best. The stuffing must be well seasoned. Dredge the pieces of meat well over with flour, and pour over it about half a pint of broth or stock; bake or for three hours. Skim all the fat off the gravy, and serve.

Beef, Brisket of (Boiled).—Lay the brisket in brine, turn every day, and rub into it brown sugar

and pickling spice. In about a week the beef is ready. Boil very slowly until the meat is quite tender, remove the bones and gristle, and press. Glaze and garnish.

Beef Cake.—The remains of cold roast beef; to each pound of cold beef allow a quarter pound of ham or bacon and pepper and salt, a few herbs, one or two eggs. Mince the meat and mix all the other ingredients, and bind with one egg, or two if required. Make into small square cakes, fry in hot dripping, and serve with brown gravy poured over.

Beef, Fillet of.—Put this in a pan to pickle for twelve hours. Cover with bacon to lard it, and add a sliced onion, parsley and seasoning. Roast for one and a quarter hours for four pounds of beef. Glaze, and pour Spanish sauce around.

Beef, Roast.—Allow one-quarter hour for each pound of meat, and one-quarter hour over. Place two metal skewers through the middle of the joint, which can be easily withdrawn before serving. The metal conducts the heat to the middle, and ensures it being cooked right through. If you prefer underdone meat, do not use skewers through the middle. Garnish with scraped horseradish.

Beef, Roast Ribs of.—Dredge the joint with a little flour, and place before a clear fire or in a hot oven. Baste often, and allow two and a half hours to ten pounds of beef. When cooked pour the dripping from the pan, add a little boiling water with a sprinkle of salt, and boil up in the pan, then pour this gravy over the joint. Serve this with Yorkshire pudding and horseradish sauce. When the ribs of beef are boned and rolled, a little more time should be allowed, such as three hours to ten pounds, as the joint is more solid.

Beef, Spiced (Cold).—Rub coarse sugar into thick flank or rump beef, and leave for twelve hours. Then rub in one ounce of pounded saltpetre, and a quarter of a pound of pounded allspice. Leave this for another twelve hours, then rub in one pound of salt. Dry the joint, put in a pan with a little oil, and bake very moderately for four hours. Turn a few times while cooking, and cover if getting too crisp.

Beef Steak and Cucumber.—Dip a rump steak in salad oil and broil over a clear fire until done; place on a dish and serve with cucumber cooked in the following way. Cut a cucumber, after peeling it, into pieces about three inches long; cut each piece into quarters, put in a stewpan with a dessert-spoonful of butter, four spring onions finely sliced, pepper and salt; put the lid on and stew quickly until tender, about ten minutes, tossing the stewpan frequently to prevent it turning, then add a teaspoonful of flour mixed with two tablespoonfuls of milk, or, preferably, cream, and a lump of butter the size of a walnut. Place round the steak and serve.

Beef Steak, Stuffed (Cold).—Make a stuffing with three ounces of bread crumbs, thyme, chopped onions, suet, salt, pepper, and bind with a beaten egg. Spread this over the steak, roll up, and tie together with string. Put in a cloth, put it into warm water with a little salt in it, and boil slowly until tender. Serve cold, cut into thin slices, with some salad garnishing.

BEVERAGES, SOME HOMELY.

Beet and Apple Cider.—One bushel of sugar beets mixed with nine bushels of apples makes a cider richer and of superior flavour to that made from apples.

Dandelion Wine.—Gather two quarts of dandelion petals—that is, the yellow petals of the flower, pour over them half a gallon of water, warm, but that has been boiled; stir, and cover with a flannel cloth, and leave for three days, stirring now and again. Strain it then, put the water into a pan and boil for half an hour with the rind of a lemon and an orange among it, and a little ginger. Then slice the lemon into it, and add one and a-half pounds of lump sugar; when cool put in a bit of bread with a quarter of an ounce of yeast in it, and leave it for a day or two; then put it in a jar and leave it for a month or two.

Ginger Wine.—To make ten gallons of ginger wine, take eight gallons and five pints of water, twenty-

four pounds of loaf sugar, thirteen and a-half ounces of ginger, four pounds of raisins, eight Seville oranges, six table-spoonfuls of yeast. Bruise the ginger, and boil the ingredients half an hour; let it stand till nearly cold, then put it into the cask with the juice of the oranges, raisins, and yeast chopped small. Let it stand six or seven days, put in half an ounce of isinglass and a quarter of the best brandy. Bung up the cask and let it stand three months, then bottle off.

Glean Gooseberry Wine.—To make nine gallons of wine, take half a bushel of fruit crushed or pounded, twenty-eight pounds of loaf sugar, a quarter of brandy, and half an ounce of isinglass. When the fruit is well crushed put the water on it; let it stand three days, stirring it twice a day; strain it, and add the sugar. When dissolved, put it in your cask, it will ferment very much. In three days add your brandy and isinglass and bung it up. Bottle it in March, and in three months it will be very like champagne. It will keep good for years.

Hop Beer.—Boil five ounces of hops slowly in nine gallons of water for about three-quarters of an hour. Strain over three pounds of brown sugar in a large pan, add a little bruised ginger, and when luke-warm add about three or four table-spoonfuls of yeast, and let it ferment. If this is to be kept, add a little brandy, for it is not easy to keep any fluid containing sugar without it. After twenty-four hours, strain off and bottle, tie down the corks tightly, or draw from a stone or wooden cask as required for use.

Lemon Syrup.—Put in a basin a pound and a-half of loaf sugar, one ounce of citric acid, with the rind and juice of two lemons. Pour over all one quart of boiling water, and let it stand till cold, stirring occasionally. Strain and bottle. A wine-glassful of this to a tumblerful of water.

BISCUITS.

Biscuits, American Breakfast.—One pound of flour, two table-spoonfuls of baking powder, quarter pound of butter, a little salt. Well rub butter into flour after sifting in baking powder, then make into a nice soft dough with milk; stale milk is really best. Roll out to half an inch thickness, cut out in rounds with a pastry cutter, bake in a very hot oven. When wanted for use cut open and butter. These are very good.

Biscuits, Clean-out.—Take half a pound of desiccated cocoanut, quarter of a pound of caster sugar, and a table-spoonful of flour. Put them in a bowl, and mix them well together. Beat up the whites of three eggs into a stiff froth, and very lightly add it to the mixture. Drop a spoonful at a time on greased paper or tin, and bake in a moderate oven until pale brown.

Biscuits, Cracknel.—Take a quart of the best flour, and four yolks of eggs well beaten, in which has been mixed a little nutmeg, a small tea-spoonful of caster sugar, and half a gill of orange or rose-water; pour this into the flour and make a stiff paste. Then roll it out, and work into it by slow degrees a pound of butter, and when thoroughly united roll out to a proper thickness, which is about the third part of an inch, and cut into strips; throw them into boiling water and let them continue to boil till they swim on the top. They must then be taken out and plunged in cold water to harden, after which they are to be slowly dried; wash the tops with well-beaten whites of eggs, and bake on tin plates in an oven sufficiently brisk to make them crisp, but by no means too dark a brown.

Biscuits, Ginger.—Mix a quarter of a pound of butter to a half pound of sugar, add one pound of flour with ground ginger to taste and two cupfuls of water. Roll this out thin, stamp out, and bake on greased flat tins. When the biscuits are done, brush them over with beaten egg, and place on sieve till cold. Keep in air-tight tins.

Biscuits, Plain.—Mix one pound of flour and twenty ounces of butter together, a pinch of salt, and enough water to work into a smooth dough or paste. Roll out thin, cut into fingers, and bake in slow oven.

Blancmange, Almond.—Take four table-spoonfuls of cornflour, a quart of milk, and sugar to taste. Mix the cornflour with cold milk to a smooth paste,

then make the remainder of the milk hot, and pour it gradually over the cornflour. Return to the saucepan and boil gently for eight minutes, stirring all the time. Sweeten to taste, and flavour delicately with almonds. Have ready two ounces of blanched and chopped almonds, stir them in the blancmange, and then pour into a wet mould. Turn out when cold.

Blancmange, Chocolate.—Grate an ounce of chocolate, and mix it with cold milk, then pour over it a quart of boiling milk. Return all to the saucepan and boil until it tastes cooked. Mix four table-spoonfuls of cornflour smoothly with cold milk; now pour over it, stirring all the time, the milk and the chocolate. Sweeten and return to the saucepan, boiling it for four or five minutes. Remove from the fire, add half a tea-spoonful of essence of vanilla, and then pour into a wet mould.

Bread, to make.—Dissolve a halfpennyworth of fresh German yeast in a breakfastcup of lukewarm water. Half a tea-spoonful of brown sugar mixed with the yeast will help it to froth. Mix in a dry, warm bread-pan three pounds of good flour, with three tea-spoonfuls of salt, and one and a half pints of water. Then make a hole in the centre, and pour in the dissolved yeast, stirring it with a spoon. Put the pan, covered to keep off draught, near the fire to rise, leaving it about an hour and a half until the centre bubbles up. Knead lightly and well. Cut the dough with a knife, shape a little with floured hands, and put in the greased tins. Put the tins near the fire, covered with a light cloth, until the dough has risen to the top. This will take from one and a half to two hours. Then bake in a hot oven. Small loaves take about an hour.

Bread, Brown, to make.—Take seven pounds of whole meal, put it into a pan and make holes in the centre. Mix two ounces and a half of yeast with one quart of warm water, pour this into the pan, and with a spoon work enough flour over and set to rise for one hour near the fire. After this time the dough will have risen, and the meal will be cracked. Then work in more water and a dessert-spoonful of salt till you have kneaded all into a light dough, and all the paste has worked from your hands. Set this to rise for an hour, covering with a cloth. Make into loaves, bake one hour.

BUNS.

Buns, Almond.—Put half a pound of ground almonds in a basin with a quarter of a pound of brown sugar, and a tea-spoonful of ground cinnamon. Mix these well together, then break in one whole egg, stir this well in; if not quite moist enough, break in another small egg, but it must be quite firm, not too moist. Put table-spoonfuls of the almond paste on well-buttered paper, not too close together, and bake in a moderately hot oven, taking care the buns do not burn, nor get too brown.

Buns, Cherry.—Sift together three-quarters of a pound of flour and one pound of ground rice; rub in a quarter of a pound of butter. Add three ounces of dried cherries cut in four, four ounces of caster sugar, two tea-spoonfuls of baking powder, two eggs, and a little milk. Bake in small, well-greased tins for about twenty minutes, and in the centre of each bun place a cherry.

Buns, Plain Doughnuts.—Beat into a cupful of milk with a pinch of carbonate of soda, one egg, a cupful of sugar, a very little flour, and stir until smooth. Add a table-spoonful of melted lard, a little salt, and enough flour to make a stiff dough. Shape the doughnuts, and drop into almost boiling fat.

Buns, Maids of Honour.—Roll gently for a quarter of an hour half a pint of milk, with two table-spoonfuls of fine bread-crumbs, two ounces of butter, and a little lemon peel and sugar; then add three well-beaten eggs, and stir till the mixture becomes quite thick. Strain through a sieve, line a dish or several patty-pans with puff paste, fill it half full of the mixture and bake.

Buns, Raisin.—Take one cup of sugar, one cup of sour-milk, one cup of raisins, small cup of butter, one tea-spoonful of soda. Flour enough to mix stiff,

CAKES.

Cake, Almond.—Put half a pound of ground almonds in a basin with half a teacupful of flour, a teacupful of sugar, the grated rind of a lemon, with one whole egg, the juice of the lemon poured on the egg. Mix this egg and lemon well into the cake mixture; if not moist enough, use part of another well-beaten egg. The cakes must be merely moist enough to make into round balls with well-floured hands. Put the cakes on a well-buttered cake-tin; bake in a cool oven until crisp and brown.

Cake, Banana.—Put in a saucepan four table-spoonfuls of sugar, four of sherry, and the same amount of orange juice; place over the fire, peel and slice thinly six bananas and add to the liquid. Cook them five minutes. Make a sponge or cup cake and bake it in a biscuit tin. When the cake is partly cool, split it and spread half of the prepared bananas over the lower part; place the top of the cake on the fruit, and put the remaining bananas over the top.

Cake, Boston.—Rub half a pound of butter into one pound of flour with the hands, then mix well with a heaped dessertspoonful of baking-powder, half a pound of brown sugar, and six ounces of grated cocoanut. Break in two whole eggs, and with a little sour milk or buttermilk mix all together. It must not be too stiff or too soft. Put it in a well-buttered cake-tin; bake in not too hot an oven one hour and a quarter.

Cake, Bread.—Separate from the dough when making common white bread as much as is sufficient for a quarter loaf. Knead well into this two ounces of moist sugar, the same quantity of butter, and half a pound of currants; warm the butter in a teacupful of good milk. When thoroughly kneaded, make the dough into the form of a cake and bake in a tin.

Cake, Caraway.—Put half a pound of flour in a basin, and with the hands rub in four ounces of sweet dripping or butter, a teacupful of brown sugar, and half a teacupful of caraway-seeds, a heaped teacupful of baking-powder, and two whole eggs. Mix well together with a little sour milk to a fine dough; well butter a cake-tin or baking sheet, put in the cake mixture, and bake in a not oven three-quarters of an hour.

Cake, Currant.—Rub four ounces of butter lightly into two pounds of flour, add half a pound of sugar, one pound of currants, half ounce of caraway seeds, and a quarter ounce of allspice. Warm a pint of milk, stir in three table-spoonfuls of fresh yeast, and make the mixture into a light dough with this liquid. Knead well, and put the dough in a tin lined with buttered paper. Leave in a warm place to rise for an hour or more, then bake in a well-heated oven.

Cake, Rich Fruit.—One pound of seedless raisins, one pound of currants, half a pound of finely sliced citron, half a pound of butter, quarter pint of good brandy, half a pint of molasses, half a pound of brown sugar, one teacupful of grated nutmeg, one teacupful of ground cinnamon, the same of cloves and mace, six eggs, and half a pound of flour sifted with one teacupful of baking soda. Dredge the fruit with flour, stir butter and sugar with a wooden spoon, and add the eggs one at a time, stirring a few minutes between each addition. Next add the molasses, brandy, spice, and sifted flour, and lastly stir in the fruit. Butter one large round cake-tin and line it with brown paper, fill in the mixture, and bake in a slow oven from three to four hours. Great care must be taken that the oven is just right.

Cake, Ground Rice.—Two table-spoonfuls of ground rice, four ounces of flour, the same of butter, two ounces of caster sugar, two eggs, and a teacupful of baking powder, with a few drops of almond or lemon flavouring. Beat the butter and sugar to the substance of cream, add rice and flour, then break in the eggs without previously beating, mix well, and add baking powder last. Bake in moderate oven.

Cake, Icing For.—One pound of caster sugar, one pound of sweet almonds, the whites of four eggs, and a little rose-water. Blanch the almonds and pound them to a paste with a little rose-water. Beat the whites of four eggs to a stiff froth. Mix them with the almonds, add the sugar, and beat all together till quite

smooth. Spread over a very rich cake, and put into the oven to dry.

Cake, Johnny.—Beat three whole eggs till light, then add to them one pint of milk (or buttermilk if at hand) and one pint of maize meal, beating them all well in. Dissolve a teacupful of bicarbonate of soda in two table-spoonfuls of boiling water, and add this to the above mixture with a teacupful of salt and two table-spoonfuls of liquefied butter. When thoroughly mixed pour it all into a well buttered shallow baking dish, and bake for thirty minutes in a quick oven.

Cake, Lemon.—Take three-quarters of a pound of dried and sifted flour, mix with a teacupful of baking-powder, a pinch of salt. Work a quarter of a pound of butter to a cream (or two ounces of butter and two ounces of clarified dripping), with the same quantity of caster sugar, and one egg. Grate the rind of one lemon, and add the flour; gradually sift in the dry ingredients with the butter, etc., and beat till all properly mixed. If the cake mixture is a little dry, squeeze into it some of the lemon juice, beat again, pour into a greased tin and bake.

Cake, Loaf.—One and a half cupfuls of sweet milk, one cupful of yeast. Stir together at night, adding flour to make a thick batter. In the morning add one cupful of shortening—half butter and half lard—one cupful of sugar, one egg, and half a lemon; nutmeg, mace, citron, raisins, and a table-spoonful of water. This makes two loaves.

Cake, Milk.—Two pounds of flour, one ounce of caster sugar, three ounces of butter, one ounce of yeast, a teacupful of milk, two eggs, half a teacupful of salt. Mix the sugar and flour together, then rub in the butter, add the salt, dissolve the yeast in the warm milk. Beat up two eggs and add to the yeast. Work this into the flour till the sides of the pan are clean; shake a little flour over, and leave it to rise in a warm place for about an hour and a half. Flour the pastry board, work the dough well together on it, take off small portions, and form them into flat cakes, place on a tin, leave the rolls to rise again for an hour near the fire, bake for twenty minutes in a quick oven, brush over with a raw egg, split lengthways, place a piece of butter in each cake, and serve hot.

Cake, Plain.—One pound of flour, six ounces of butter, six ounces of sugar, six ounces of currants, one teacupful of ginger, one ounce of baking-powder, two eggs, and a little lemon peel. Mix with milk, and bake in a quick oven.

Cake, Pound.—Eight eggs, beaten separately; not quite a pound of butter, one pound of powdered sugar, not quite one pound of prepared flour, or flour with two heaping teacupfuls of baking-powder. Beat the yolks, sugar, and butter together, then add the beaten whites and flour by degrees, alternately, until both are stirred in; flavour with lemon.

Cake, Plum (small).—Rub three ounces of butter into a pound of flour, then beat up the yolks of two eggs, and the white of one; warm a little milk, and mix the flour and butter with them; wash, pick, and dry a pound of currants, and stir them well in, then form into small cakes. Bake on a tin in a moderate oven.

Cake, Queens.—Take the weight of two eggs in sugar, flour, and butter. Beat the sugar and butter to a cream, then work in the yolks of two eggs, sift in the flour, add one ounce of currants; and, at the last, the stiffly whipped whites of the two eggs. Bake in buttered tins for ten minutes.

Cake, Rice.—One pound of flour, half a pound of rice flour, half a pound of sugar, half a pound of butter, four eggs, two teacupfuls of baking-powder, one teacupful essence of vanilla, salt, and milk. Beat the butter to a cream, add the yolks of the eggs, and the sugar; beat very lightly. Then add the flour, after being well dried before the fire or in the oven, baking-powder, pinch of salt, vanilla, and sufficient milk to make a nice thick batter. Beat up the whites of the eggs to a stiff froth, and add them last. Mix all very lightly, and bake for two hours in a moderate oven.

Cake, Seed.—A quarter of dough, half a pound of butter, three-quarters of a pound of sugar, one ounce of caraway seeds, and three eggs. Cream the butter, and knead it in with the dough, and the sugar,

caraway seeds, and the well-beaten eggs; knead them well together, and leave it to rise near the fire for about an hour in the cake tin; bake for two hours.

Cake, Soda.—Add together one pound of flour, half pound of butter, two teaspoonfuls of carbonate of soda, one teaspoonful of baking-powder, half a pound of sugar, half a pound of currants, a quarter of a pound of lemon peel, a little nutmeg and salt. Bake two eggs, well-beaten, and one gill of milk. Also about two hours in hot oven.

Cake, Sponge.—Five eggs, the weight of four eggs in caster sugar, and the weight of three eggs in flour, the juice and grated peel of half a lemon. Mix the eggs with the sugar and peel, add the lemon juice, whisk for three-quarters of an hour, then stir in the flour by degrees, whisking all the time, and pour into tins which have been previously buttered and sugared, and put at once into a moderately hot oven.

Cake, Sultana.—Pass three-quarters of a pound of dry flour through a sieve, with a heaped teaspoonful of baking powder, and a pinch of salt. Beat together five ounces of butter with five ounces of caster sugar, a tablespoonful of brandy, in which some mixed spice has been stirred. Into the flour put half a pound of sultanas, and two ounces of chopped peel. Work in three eggs to the butter and sugar, and then the dry ingredients very slowly. Beat the whole for five minutes. Put into a tin, and bake steadily.

Cake, Tea.—One pound of flour, half a pound of butter, a teaspoonful of salt, and a saltspoonful of baking powder. With a little milk or water mix these ingredients to a paste, roll it out, cut it into rounds the size of the cakes required (small ones are best), and bake them over the fire or on a flat tin in the oven. When rising the cakes should be turned, and allowed to bake to a golden brown. Serve buttered in a covered dish.

CHEESE.

Cheese Creams.—Roll out puff paste very thinly, and cut into rounds. Stew two ounces of cream, and the same quantity of grated Parmesan cheese, adding a little salt and cayenne, and place the mixture in little piles on each round of pastry, moisten the edges, put a round on each, making tiny turnovers of them. Egg these over, roll in breadcrumbs, and fry in boiling fat.

Cheese Pâté.—Put two ounces of grated Parmesan cheese into a basin with one ounce of butter, yolks of two eggs, the white of one, and a little salt and cayenne. Fill patty-pans, lined with paste, with the mixture and bake. Sprinkle a little grated cheese over them, and serve hot.

Cheese Rarebit.—Take half a pound of cheese, one ounce of butter, a tablespoonful of ale, a little salt and mustard, some buttered toast. Put the butter in a pan, and when it has melted put in the cheese, sliced, the seasonings, and the ale, and when all are incorporated into a thick cream, pour it over and serve hot.

Cheese Rarebit without Ale.—Put into a saucepan a tablespoonful of tomato ketchup, a teaspoonful of relish or bottled sauce, and one pound of chopped soft American cheese, and half a gill of water. Stand this over the fire, stir and beat rapidly until smooth. Pour on to toasted bread, and serve.

Cheese Rashers.—Fry some nice rashers of bacon in thin slices. Take out when cooked, and fry some thin slices of onions in the fat. When done, take out of the pan, and keep hot with the rashers, then fry some slices of good old cheese. Add all together, and serve hot.

Cheese Spaghetti.—Break half a pound of spaghetti in a pan of salted boiling water, boil till tender, and strain thoroughly. Melt one ounce of butter in a saucepan; stir into it a teaspoonful of flour and one tablespoonful of mustard. Add the spaghetti with a tablespoonful of milk; when hot mix in a quarter of a pound of cheese to taste; boil up, turn into a buttered pie-dish, sprinkle breadcrumbs on top, with a few pieces of butter here and there; brown on the surface, and serve with dry toast.

Cheese Straws.—Take two ounces of Vienna flour, mix in a little pepper and salt, and the merest

pinch of cayenne. Rub in two ounces of butter, then add two ounces of grated Parmesan or some grated cheese of a strong, dry kind. Mix this into a smooth paste with the yolk of an egg and a few drops of lemon juice. Knead the paste and roll it out thin and square. Cut into strips, and bake on a greased tin.

Cheese, Tomatoes and.—Put an ounce of butter into a small stewpan, with a tablespoonful of minced onion, and fry it. Before the onion colours, throw in half-a-dozen large tomatoes cut in small pieces, and allow them to cook thoroughly. Butter a fireproof dish, pour in the contents of the stewpan, and cover with a layer of Parmesan or any similar cheese. Bake for ten minutes, and serve very hot.

CHILDREN, COOKERY FOR.

Children, Dumplings for.—Chop finely two-pennyworth of fresh beef suet and mix it with half-a-pound of flour, a large pinch of salt, and sufficient water to make a large stiff paste. Next chop finely together the following ingredients—two ounces of any meat—beef, mutton, or veal, which may have been left from the previous day's dinner, a Spanish or large English onion, a good-sized sprig of parsley, a pinch of sweet herbs, salt to taste, and a very little pepper; bind with the yolk of an egg. Next work this mixture thoroughly into the suet paste, and form into small dumplings. Boil in the stockpot, which should always be placed at the side of the stove as soon as the fire has "drawn up." Serve with a little plain, very hot gravy, which should have been saved for the purpose.

Children, Eggs for.—Take two eggs and break them, beat them up well. Have ready a slice of buttered toast. Put a small teaspoonful of milk to warm with a little salt in it, in an enamelled saucepan. When quite hot, mix the eggs and milk, and keep stirring it until it begins to curdle, take up with a spoon, and place in heaps on the toast. Two eggs will be enough for three little children.

Children, Gingersnaps for.—One cupful of thick treacle, one half-cupful of fresh butter, one teaspoonful of ginger, one half-teaspoonful of powdered cinnamon, one-fourth of a teaspoonful of salt, one small teaspoonful of baking soda. Flour enough to roll. Work the butter and treacle well together, add soda, and beat again to a foam; stir in salt and spices, then the flour, sifted. Turn out on the bread-board, and roll out one-fourth of an inch thick; sprinkle the top with granulated sugar, then grated fresh coconut (two tablespoons of each is all that is required) cut out with a round cutter, and bake in a quick oven.

Children, Milk for.—Should be given boiled, and with or without water, to children, both for tea and breakfast. Coffee and tea, even if weak, are unsuitable for the little ones, and the longer they will take milk alone the better it will be for them. Milk should not, however, be given at dinner, as it is too heavy to be taken as a drink with substantial food.

Children, Porridge for.—Porridge should be freely eaten by children. Oatmeal contains lime, which is necessary for hardening children's bones. It should be thoroughly boiled, or it is indigestible.

CHRISTMAS COOKERY.

Christmas Cake.—One pound of butter, one pound of caster sugar, one pound of mixed peel, one pound and a half of flour, one pound of dried cherries, eight ounces of almonds, half a pint of brandy, ten eggs, one teaspoonful of salt, and one pound of sultanas. Cream the butter, add the sugar and salt, then the eggs one at a time, beating well for four or five minutes with the hand after adding each egg. Mix in the chopped cherries, almonds, picked sultanas, and brandy, and last, stir in the flour. Put the mixture in a cake-tin lined with three folds of buttered paper, and bake from three to four hours in a moderate oven.

Christmas, Mince Pies for.—Mix one pound each of raisins, currants, minced peel, suet, apples, and add the juice of three lemons, sugar to taste, a little nutmeg, and a little marmalade. All the ingredients should be minced or chopped together.

Christmas Plum Pudding.—A pound and a

half of raisins, a pound and a half of currants, a pound and a half of moist sugar, a pound and a half of suet, one pound of breadcrumbs, one pound of flour, six ounces of candied peel, one nutmeg, one ounce of mixed spice, the rind of a lemon, two wineglassfuls of brandy, ten eggs, and a quarter of a pint of good old ale. Chop the suet, stone the raisins, wash and dry the currants, cut the candied peel into thin slices, then mix all the dry ingredients together. Beat the eggs (whites and yolks together) and strain them into the pudding; stir in the brandy and ale. Grease one large, or three or four small pudding-basins, and fill with the mixture; cover with a stout greased and floured pudding cloth, and boil for from six to seven hours.

Christmas Pudding, another way.—One pound of raisins stoned and cut, one pound of currants, one pound of sultanas, one pound of foot sugar, one pound of suet, three-quarters of a pound of mixed peel (chopped finely), one pound of breadcrumbs, quarter pound of sweet almonds (chopped), half pound of golden syrup (soften with a cup of warm milk or more if needed), two lemons (rind and juice), eight eggs (beat well), one canister (scruped) two wineglassfuls of rum (can be omitted if not approved). Be sure fruit is well dried after washing. Teaspoonful each of salt, nutmeg, and spice, about breakfastful of flour. Mix thoroughly together, and boil twelve hours. This will make three convenient sized puddings.

COLD MEAT COOKERY.

Cold Chicken, To use up.—Steep the remains of cold boiled chicken in oil, pepper and salt. Flavour half a pint of milk with a little carrot, turnip, onion, blade of mace, few peppercorns, mixed herbs, and half an ounce of isinglass or gelatine. Boil well, and then strain away the vegetables, etc. Add butter and thicken, let it boil for five minutes, add a gill of cream, and boil again, stirring well; season with pepper and salt. Pour this sauce on the meat, leave to cool and ornament with beetroot on the top, surround with salad and cucumber, and serve.

Cold Meat, Curried.—Cut thin slices of cold roast meat into rather small pieces; slice thinly, and fry an onion in about two tablespoonfuls of butter until nicely brown; then pour in as much good broth as required for the gravy; add a little salt and a tablespoonful of curry powder; let it boil up, and add the beef; stir constantly for ten minutes; make a wall of boiled rice round side, and pour the curried meat in the middle.

Cold Meat, Rolls made from.—Take any little pieces of cooked meat, two or three different sorts if you happen to have them, and mince them; season them with pepper and salt, and either herbs or parsley alone, or curry powder, according to taste; make a crust with cold boiled potatoes, a little milk, and flour; place little pieces of the seasoned meat inside the crust, which must be cut according to the size you wish; moisten the meat with gravy, water, or milk, roll up in the crust, and bake for half an hour.

Cold Meat, Stewed.—Take about two pounds of cold meat, beef preferably, and cut it into small square slices. Fry four onions brown, put them in with the meat, add one and a half pints of stock, together with cut up carrot, a teaspoonful of mixed herbs, pepper and salt to taste. Let all gently boil for one and a half hours with the lid on. Colour a rich brown and thicken with flour, boil up and serve with toast and small potatoes.

Cold Meat, Using up.—Cut slices from a cold joint of beef or mutton not more than half an inch thick; break one whole egg on a plate and mix white and yolk together; season with pepper, salt, finely-chopped onion, and a tablespoonful of grated cheese. Mix these, dip in each slice of meat, and put at once in frying pan of boiling dripping. Fry for two minutes on each side, and dish them on a mound of mashed potatoes. Serve hot.

CONFECTIONERY.

Candy, Lemon.—Take three pounds of preserving sugar, set it over a slow fire with a half-pint of water, and let it boil about thirty minutes; then

dissolve one teaspoonful of gum and add it with a teaspoonful of vinegar to the sugar. Boil all together till it is brittle, remove from the fire, and flavour to taste, with lemon juice or essence of lemon. Rub the hands with butter, and pull the mixture till it is nearly white, then stretch it into a long stick and twist it.

Confection, A Nice.—Take two pounds of granulated white sugar and put it in a clean pan, with water sufficient to melt it, on a clear fire, and stir. Have ready one pound of good raisins or currants, dry and clean picked. When the sugar is melted put the fruit in, put on lid, and steam for five or ten minutes, taking care that it does not burn. Then add gradually one to three ounces of fresh butter if you want it to be very rich. After five minutes take off the fire, and stir the contents of the pan with a stick till it turns thick, then pour out into a buttered tin. Leave to cool a little, and season with lemon to taste. Turn out before it gets too hard, cut into slices, and keep in a tight canister or glass bottle.

Toffee, To Make.—One pound of brown sugar, two ounces of butter, and a saltspoonful of cream of tartar, boiled for about two or three minutes, or until a piece will crack if placed in cold water. It must not be stirred during cooking.

Toffee, Almond, To Make.—Boil together one pound of Demerara sugar, two ounces of butter, three tablespoonfuls of milk, and a saltspoonful of cream of tartar, for about twenty minutes. Then drop a small quantity into cold water; if it hardens at once, so that the toffee will snap, it is done. Have ready two ounces of almonds, blanched and cut in shreds, scatter them on greased tin, and pour the hot toffee over.

Toffee, Everton.—Take one pound and a half of brown sugar, nine ounces of butter, a tea-cupful of water, and one lemon. Boil the sugar, water, butter, and half the rind of the lemon together for about ten minutes. Drop a little into cold water, and if it is done enough it will turn hard at once. Draw this off the fire, and stir into it the lemon juice. Then pour it on a buttered plate to cool.

Turkish Delight.—A pound of loaf sugar, half an ounce of gelatine, juice of one lemon, and six drops of cochineal; one tea-cupful of water. Soak the gelatine in half a tea-cupful of water for three hours. Boil the sugar for five minutes with the remainder. Pour over gelatine, and cochineal, and lemon juice, and stir well. Pour into wetted pie-dish, and cut when cold. Roll in icing sugar.

CROQUETTES.

Croquettes, Fish.—Almost any fish, fresh or dried, is suitable. Mix a proportion of one quarter of fish to bread crumbled. Mix with well-beaten eggs, and season with pepper, salt, chopped parsley, and a very small quantity of dried sweet herbs. For salmon croquettes a good way is to make a tea-cupful of thick melted butter sauce, grate a little nutmeg into it, a tea-spoonful of chopped parsley, and a cupful of shredded remains of salmon. Stir it well in the saucepan and put over the fire, when hot take it off and whisk into it the yolk of an egg beaten up with the juice of half a lemon. Spread it on a plate to get cold. When quite cold divide it into tablespoonfuls, dip each lightly in flour, then brush over with a beaten egg, and cover with breadcrumbs. Fry brown in boiling fat.

Croquettes, Lentil.—Wash a pint of lentils, boil them in three pints of water till the lentils are soft. Strain, and run through a sieve; add a minced onion, pepper and salt, a lump of butter, and a well-beaten egg. Form into balls, egg and breadcrumb them, fry in hot fat. Drain and serve with curry sauce.

Curry, Indian.—Rub smoothly together half an ounce of coriander seeds, three chopped onions, a drachm of cayenne pepper, a drachm of ground ginger, and four cloves. Put a good lump of salt butter in a stewpan, and after rubbing a chicken inside and out with the seasoning, put it in the melted butter, and fry it until nicely browned. Turn constantly and squeeze lemon juice over. Serve at once with plainly-boiled rice in a separate dish, and sprinkled with chopped red capsaucins.

CUSTARDS.

Custard, Aunt Maria's.—Put half a pint of milk into a saucepan with a little lemon rind, and let it simmer gently till flavoured. Sweeten to taste, and let it cool, taking out the lemon. Whisk three eggs lightly, and add to the milk. Line a pie-dish with a good short crust, pour in the custard, grate a little nutmeg over the top, and bake in a slow oven.

Custard, Beef Tea. (See Invalids, Cookery for.)

Custard Cheese.—Butter custard-cups thoroughly, and cut thin slices of bread and butter into small dice, arranging them in a pattern on the sides of the cups. Scatter grated cheese—Parmesan, if possible—over all. Make a good custard with the yolks of two eggs and three-quarters of a pint of milk. At the last minute, before cooking, add the whites, beaten to a froth. Season with salt, pepper, and cheese. Fill up the moulds, and steam very slowly till set. Turn out and garnish with chopped parsley.

Custard, Chocolate.—Heat three ounces of grated chocolate till it dissolves in a little milk. Add more milk, making about a quart in all, and let it boil up. Let all this steep together at the side of the fire for about ten minutes, then sweeten to taste, and add slowly four well-beaten eggs. Stir while the custard simmers till thick enough. Add vanilla flavouring, and, when cold, pile a little whipped cream on top.

Custard Lemon.—Put half a pint of water in a saucepan, add to it the grated rind and juice of two lemons; sweeten with lump sugar. When the sugar has melted pour it on three eggs that have been well beaten, stirring all the time. Return to the saucepan, and stir over the fire until it thickens, taking care not to let it boil. Serve in glasses with whipped cream.

EGGS. (See also Omelettes.)

Eggs, Boiling.—Eggs are far more nourishing if, instead of boiling over the fire, they are placed in a basin with boiling water over them, and allowed to stand for five minutes.

Eggs, Boiling Hard.—An egg may be boiled hard in five minutes. But it is a curious fact that if an egg be boiled steadily for an hour it becomes mealy, and in this state is much pleasanter to eat than one boiled for a shorter time.

Eggs, Buttered (with Mushrooms).—Put two ounces of fresh butter into a stewpan, break over it four very fresh eggs, and three tablespoonfuls of chopped mushrooms, half a teaspoonful of salt, one tablespoonful of ground white pepper. Stir this mixture over a clear fire with a wooden spoon until it is of a thickish consistency, and serve very hot, poured over hot well-buttered toast.

Eggs, Curried.—Slice thinly an onion, fry brown in two tablespoonfuls of butter, add a tablespoonful of curry powder, one pint of good broth, and a little salt; let it cook until the onions are tender; thicken one-fourth pint of cream with a little cornflour, and stir into the other ingredients; let it simmer a few minutes, then add twelve hard-boiled eggs cut into halves, warm through, and arrange the eggs upon a platter with the gravy poured over them.

Eggs, Poached.—A pint of water, one tablespoonful of vinegar, a tablespoonful of salt, as many eggs as are wanted. Put the vinegar and salt into the water, let it boil, then break the eggs very carefully into it, and boil gently for three minutes until they are set; when cooked take them out with a slice, let them drain, and serve on buttered toast.

Eggs, Poached on Anchovy Toast.—Poach the eggs very carefully, and when cooked and neatly trimmed round the edges, place each one upon a hot buttered toast, previously spread with a thin layer of prepared anchovies. Butter, sprinkle the surface very lightly with minced parsley, and serve immediately.

Eggs, Poached, with Tomato Sauce.—Place a pound of sliced tomatoes in a stewpan, add a slice of onion, a bay leaf, and some whole pepper. Cover, simmer gently for five minutes, strain, and pass all the pulp through a sieve. Return the pulp to the stewpan, add two ounces of butter rubbed into a tablespoonful of flour. Stir all together till thickened,

adding a little white stock or water if necessary; season carefully, and stand aside. Poach as many eggs as you wish to serve, and turn them out on rounds of buttered toast cut the size of the eggs. Pour the tomato sauce round each egg, scatter chopped parsley over the eggs, and serve.

Eggs, Scrambled.—Four eggs, two ounces of fresh butter, half a teaspoonful of salt. Have ready slices of hot buttered toast to put the eggs on when done. Lay the toast on a dish in front of the fire. Place the butter and salt in a white enamelled saucepan, break the eggs quickly on the butter, place on the fire, and stir one way with a spoon until a change is seen in the mixture. Take it from the fire, still stirring, and spread upon the toast in four portions; pepper and serve very hot.

Eggs, Snow.—Separate the whites from the yolks of six eggs, and whisk the latter to a stiff froth with a tablespoonful of castor sugar. Put a quart of milk into a saucepan, sweeten it to taste, bring nearly to the boil; then take two dessert spoons, and shape the white of egg, dropping it one by one into the milk; when set on one side, turn over; then take out and drain on a sieve. Strain the milk into another saucepan, and let it get cold, mix with the yolks of the eggs and simmer gently over the fire to make a custard; flavour with vanilla, pour into a glass dish, when cold lay the snow eggs on the top.

FISH.

Cod Fish Balls.—Pick the fish, when washed, into one cupful of fine shreds. Peel some potatoes and cut into small pieces. Boil the fish and potatoes together until the potatoes are tender. Then strain through a colander. Mash these, and add butter, pepper and salt, and a beaten egg. When these ingredients are thoroughly mixed, shape into balls, and fry in boiling fat.

Cod's Roe, Fried.—Boil the roe for about eight minutes in water with a little salt and vinegar, divide the roe into neat pieces, egg and breadcrumb it, and fry a light brown in deep fat. Serve with anchovy sauce.

Cod Steaks, Stewed.—Fry one chopped onion in a little butter, add to it a teaspoonful of fish stock, a piece of lemon rind, pepper and salt. Boil for a few minutes. Put in two cod steaks about an inch thick, put on the lid, and stew gently until done. Dish up the cod, and thicken the liquor, adding butter and chopped parsley. Pour on the fish, and serve.

Eels, Stewed.—One and a half pounds of eels, one onion stuck with cloves, lemon peel, half a pint of stock, half an ounce of flour, lemon juice. Wash and skin the eels, cut into pieces about three inches long, sprinkle pepper and salt over them, and lay them in a stewpan; pour in the stock, add the onion, lemon peel, etc., and stew for about half an hour, lift out the fish, thicken the sauce with the flour, add cayenne and a squeeze of lemon, boil it up, pour round the fish, and serve hot.

Fish and Tomato.—Take about a breakfast-cupful of cooked fish, remove all the skin and bone, and break up finely. Pass the pulp of four tomatoes through a sieve to remove the seeds, and blend it with the fish. Season and add a beaten egg and one ounce of melted butter, stir well, and press into small buttered cups, cover each with a buttered paper, and steam for half an hour. Turn out on to fried bread, and garnish with plainly-boiled rice (prepared as for curry).

Fish, Baked.—Wash and dry any fish, weighing four or five pounds, dredge with salt and pepper, and place in a buttered pan. Pour over it a quart of chopped tomatoes, a large onion chopped fine, and a large spoonful of chopped parsley. Add a little cayenne pepper and salt. Pour over all one half-cupful of fine oil or melted butter, and then bake slowly until well done.

Fish Balls.—Shred cold boiled flaky fish very fine, and add a sauce made with one ounce of butter, one tablespoonful of flour, and half a cupful of milk, put all in a saucepan; the sauce should be very thick. When all is hot, add two beaten eggs, pepper and salt. Then drop the mixture, which should be like

batter, from a spoon into very hot fat. It will puff, and be very light.

Fish Cakes.—Take equal weights of fish and potato which has been previously boiled. Break up the fish, free from skin and bone into flakes, and rub the potatoes through a fine sieve. Mix potatoes and fish together and season with salt and cayenne, adding a few drops of anchovy and a squeeze of lemon juice; put all into a basin, and make into a paste with a little milk, melted butter, and a lightly-beaten egg. Make the paste into small round cakes, roll first in a beaten-up egg, and then in breadcrumbs. Fry the cakes until they are golden brown, then serve hot.

Fish Patties.—Poor boiling water over a dried haddock, let it stand until cool, remove the skin and the bones, break it in pieces, and put it into a basin with two potatoes mashed smoothly. Make, and cut out some rounds of paste with a tumbler, two for each patty. Mix up the fish and potato with one whole egg, a little parsley, and pepper; put a piece of the mixture on one round of the paste, just wet the extreme edge of the paste, cover with a second round, press them well down at the edge, put them on a baking tin, and bake for twenty minutes in a moderately hot oven.

Fish Fudding.—Shred a pound of any cold boiled fish, add one ounce of butter, and let it stand over a slow fire till the fish is warmed through. Soak bread in milk until soft, then beat it up finely with two eggs, a teaspoonful of anchovy essence, one of ketchup, salt and cayenne. Mix, put in a greased basin, and steam for one hour, or bake in the oven for thirty minutes.

Haddock Finnie.—Rinse a deep pie-dish with very hot water, then lay the fish in the dish, pour boiling water over it, cover the dish closely with a plate, and let the fish remain in this boiling water some eight or ten minutes, or less, according to size. When heated through remove the haddock from the dish, lay it on another hot one, pepper nicely, rub over with butter, and serve.

Haddock, Stewed.—Hold a dried haddock before the fire, when the skin will come off easily. Then cut it up in square pieces, lay it in a pan, pour boiling water over it, stew ten minutes. Pour off the water, and add sufficient milk to cover. Add butter, pepper, and salt. Stew ten minutes longer, then thicken the milk with flour. Take out the fish, and pour the sauce over it.

Hake, Baked.—Slice the hake into pieces one inch thick, dip each slice into vinegar, and then in the following dry ingredients well mixed together, six tablespoonfuls of breadcrumbs, one tablespoonful of grated cheese, the same of parsley, onion, and flour, pepper and salt one saltspoonful each. Thickly butter a baking tin, lay the slices in after they are well coated, put a piece more butter on each slice, and bake for thirty minutes.

Halibut Cutlets.—Before cutting the fish into slices put it into a dish with some salt over it, and three parts fill the dish with water, but it must not touch the salt. After an hour take it out, dry it, and cut it into a batter and fry in boiling lard. When brown turn, and fry the other side. Drain, and serve with shrimp sauce.

Herrings, Baked.—Remove the heads from half a dozen fresh herrings, and clean the fish thoroughly. Put them in a deep pie-dish with salt, allspice, cloves and peppercorns, a blade of mace, and a teaspoonful of grated horseradish. Add a gill of cold water and the same quantity of vinegar. Bake in a slow oven for thirty-five minutes. Serve cold.

Herrings, Devil'd Salt.—Fillet the herrings, and soak in two tablespoonfuls of olive-oil mixed with one tablespoonful of tarragon vinegar for an hour, then wipe dry. Grill for five minutes. Spread toasted bread rather thickly with cheese kneaded into a paste, with a high seasoning of mustard and some hot sauce. Place a grilled fillet of herring on each piece of toast, and serve on lettuce leaves.

Lobster, Baked in the Shell.—Divide two small lobsters, chop the meat into small pieces. Dissolve an ounce of butter in a saucepan, stir in a tablespoonful of flour, a chopped onion, and by degrees half a pint of milk. Stir till all boils, add a beaten egg, and season with salt and cayenne. Put the chopped lobster

back into the half shells, pour dressing over it. Scatter breadcrumbs over, and bake fifteen minutes. Serve hot.

Mackerel, Filleted.—Well wash, cut off the head, and cut the fish from the bone on both sides. Cut each half in two, well season with pepper and salt. Beat up an egg until white and yolk are well mixed; dip each piece of mackerel in flour, then in beaten egg, and again into finely grated breadcrumbs. Have ready a frying pan half full of boiling dripping, put in the fish, and fry for ten minutes. Serve with parsley sauce and mashed potatoes.

Mackerel.—Cleanse, and lay it flat in a deep frying pan, the bottom of which has been rubbed with butter or beef dripping, and just cover it with milk. Put two onions sliced, and a sprig of parsley and lemon thyme into the milk, and a sprinkling of pepper and salt; cover the fish with a plate or dish, and boil it for twenty minutes. Turn on to a hot dish when ready.

Oysters, Broiled.—Beard two dozen large oysters, and lay them, for a few minutes in a clean dry cloth. Brush each over with a little warm butter, and sprinkle with pepper and salt. Brush the bars of the gridiron with a little of the butter. Cook over a brisk fire for about three minutes. Serve hot on buttered toast.

Oysters, Creamed.—Heat the oysters in their own liquor till plumped out. Stir in a lump of butter, and add pepper and salt. Heat some cream in a double boiler. Before placing each oyster into a puff paste case, put them into the hot cream, heating on the top.

Plaice, Boiled.—Wash the fish, and place in boiling water, with a tablespoonful of salt. Simmer gently for twenty minutes. Garnish with sliced lemon and parsley, and serve with white sauce.

Prawns and Mayonnaise.—Cut strips of bread about two inches long and an inch wide; fry a light brown and let them get cold. Lay some thin slices of tomato on the fried bread, cover thinly with mayonnaise sauce, then put a small strip of cucumber next, and on top of this a prawn dipped in mayonnaise.

Salmon, Boiled.—Place about two and a half pounds of fresh salmon in a fish-kettle, and cover with boiling water; add one heaping tablespoonful of salt, one onion cut into quarters, one small carrot, six whole peppers, a bouquet and half gill of white vinegar, boil up, and then let it simmer for ten minutes. Remove the fish carefully and serve.

Salmon Cutlets, Boiled.—Take a slice of salmon of a good thickness, and put in a stewpan with a small onion, a spoonful of chopped parsley, a few small mushrooms, pepper and salt, and half a pint of stock and red wine in equal quantities. Boil the fish till done; take it out, roll a bit of butter in two spoons full of flour, thin it with some of the liquor of the fish, let it boil up, and pour it over the salmon. This fish should be eaten directly the sauce is poured over it.

Sardines and Cheese.—Warm some sardines in the oil from the tin, add pepper, salt and juice of lemon. When hot, lay the sardines on a hot dish, sprinkle grated cheese over them; thicken the sauce with a little flour and the yolk of an egg, and mask the sardines with it; garnish the dish with fried crotons.

Shrimps with Eggs.—Shell about three dozen shrimps, dust them lightly with cayenne pepper, and put in the oven with melted butter to get warmed through. Meanwhile, put one ounce of butter in a stewpan, break into it three eggs, and season to taste with salt and pepper. Stir for two minutes, then add the warmed shrimps, and stir all together until it begins to set; then draw the pan to the side of the fire, so that it may not cook too quickly. When the eggs have thickened lay the mixture on squares of hot buttered toast, and serve.

Soles, Baked.—Fillet a large sole; cut each fillet into long strips about an inch thick and tie into a knot, put them in a buttered tin with a piece of buttered paper over them, bake in moderate oven for so minutes, place on dish, and pour tarragon vinegar over.

Foremost Balls for Hare.—Cleanse and boil the liver of the hare. Mince and mix with about six tablespoonfuls of white breadcrumbs, two table-

spoonfuls of ham or bacon, four tablespoonfuls of suet, one tablespoonful of parsley, and half the rind of a lemon, all chopped finely. Season with cayenne and salt, and mix all together, moistening with two eggs well beaten. Form into small balls. Flour well, and fry in boiling fat.

Force meat, Chestnut, for Boiled Poultry.—Peel half a pound of chestnuts and boil. Then remove the skins, and cook in a little stock. Pound them with an equal quantity of white bread crumbs and butter, and season with grated nutmeg, pepper and salt. Bind with the yolk of an egg.

Force meat (Dry) for Fish.—Add six tablespoonfuls of fine white bread crumbs two tablespoonfuls of chopped parsley, one teaspoonful of mixed herbs, half a teaspoonful of grated lemon rind, and a seasoning of salt and pepper. Mix thoroughly, and lay, dry as it is, between the fish, boned and cleansed, and bake on a greased baking sheet.

Force meat for Game.—Take about half a pound of raw veal, quarter of a pound of bacon, quarter of a pound of calf's or lamb's liver, and the livers of the game to be used. Fry these, adding seasoning of salt, pepper, and the yolk of one egg. A small quantity of mushroom purée is sometimes used.

Force meat for Turkey, Fowl, Veal, etc.—Mix together half a pound of white bread crumbs, quarter of a pound of finely-chopped suet, a teaspoonful of salt, half that quantity of pepper, a tablespoonful of chopped parsley, a teaspoonful of mixed herbs, a saltspoonful of grated lemon rind, and a little grated nutmeg. Moisten with two eggs well beaten, and a small quantity of milk.

Force meat, Oyster.—Half a pint of oysters, five ounces of bread crumbs, one ounce of butter, the peel of half a lemon, a sprig of parsley, salt, nutmeg, a very little cayenne, and one egg. Beat half a pint of oysters, mince very fine, and mix with them the lemon peel chopped small, the chopped parsley, salt, nutmeg, cayenne, and about one ounce of butter in small pieces. Stir in five ounces of bread crumbs, and bind with the yolk of an egg, and part of the oyster liquor.

FITTERS.

Fritters, Apple.—Peel, core, and slice the apples. Mix a batter of four ounces of flour, a pinch of salt, add two beaten eggs. Dip the rings of apple into the batter, and fry in boiling fat to a nice golden brown. Serve hot, and sprinkle with fine castor sugar.

Fritters, Cheese.—Cut some long, thin strips of cheese, about two inches long and an inch wide. Lay them for half an hour in a little oil, vinegar and pepper. Next make some batter by putting two ounces of flour into a basin with a few grains of salt; make a hole in the middle, and mix slowly into it three tablespoonfuls of tepid water, to which half a tablespoonful of melted fat has been added. Beat all well together, then whisk stiffly the white of one egg and stir it in lightly. Have a pan of fat so hot that a lamb smoke rises from it. Dip the slices of cheese into the batter with a skewer, then drop them into the fat, and fry a golden brown.

Fritters, Custard.—Half a pint of milk, five eggs, half a cup of sugar, one gill of cream. Beat milk, cream, sugar and eggs together, strain, put into a small bowl, set in a saucpan, with boiling water to reach half-way up the sides of the bowl. Steam gently until set, allow to cool. Cut into pieces about one and a half inches long by one square; dip in batter and fry till brown.

Fritters, Fish.—Pound the remains of any cold fish, mix it well into some batter. Drop the mixture by spoonfuls into a pan of seething fat, and serve immediately. An excellent breakfast dish, or good as a garnish to serve with a dish of fish.

Fritters, Savoury.—Five ounces of onion, one teaspoonful of powdered sage, four eggs, and four ounces of stale bread. Soften the bread thoroughly in a dish with a little boiling water, covering it over, and letting it soak for an hour; mash it with a fork, picking out the hard pieces; boil the onion in two or three waters till quite soft, chop small, add the powdered sage, pepper and salt, and the eggs well beaten; mix

the whole intimately with the bread, and fry in fritters about half an inch thick and three inches broad.

FRUIT COOKERY.

Almonds, Salted.—Put the shelled nuts into a bowl, and pour boiling water over them. Cover them and let them stand for about ten minutes. Then strain and skin them. When blanched thus throw them into cold salted water. Dry them, and sprinkle with olive oil, stirring well. Sprinkle with salt, and bake in shallow dish.

Ambrosia.—Peel six oranges and cut into pieces. Slice up one lemon with the rind on it; cover all with castor sugar. Allow to stand for two or three hours before serving.

Apple Chutney.—One and a quarter pounds of apples stewed in one and a half pints of vinegar to a pulp. When cold add quarter of a pound of brown sugar, three ounces of salt, quarter pound onions, chopped fine, two ounces ground ginger, three ounces mustard, quarter ounce of cayenne pepper, quarter pound raisins, chopped fine. Put in a jar and keep, the longer the better.

Apples, Coddled.—Choose some large, sharp apples of even size. Remove the cores, then peel them. Place them in a stewpan, sprinkle thickly with sugar, and put a clove in the middle of each. Put on the lid, and steam them on the back part of the stove till soft, but not broken. Dish carefully.

Apples, Compote of.—Peel six ripe apples, halve and core them, and rub each with a slice of lemon. Put half a pound of lump sugar and half a pint of water together in a luted saucpan, and boil until it forms a syrup—about ten minutes. Put in the apples, the thinly pared rind of the lemon, and the juice. Simmer until tender, then take up carefully so as not to break the fruit. Strain, and reduce the syrup by boiling very quickly. Arrange the fruit, when cold, on a glass dish, colour the syrup, pour it over the fruit, and garnish with little strips of citron.

Bananas, Baked.—In South America bananas are baked and eaten as a substitute for meat. They are slit and buttered, then baked, like the homely potato "in their jackets" for half an hour.

Bananas, Scalloped.—Cover a buttered pudding dish with a thick layer of sliced bananas; over this put two tablespoonfuls of sugar, and moisten with lemon juice, and then sprinkle a layer of bread crumbs, repeating this process till the dish is filled; pour a little melted butter over the top, and bake till the top is slightly browned.

Chestnuts, Devilled.—Boil half a pound or chestnuts in their shells till tender, peel and skin them, and soak in a good strong bottled sauce for half an hour or more, melt half an ounce of butter in a saucpan, put the nuts in. Stir about till heated through and serve very hot.

Gooseberry Cream.—Cook a quart of green gooseberries till soft with three ounces of white sugar, and pulp through a hair sieve. Beat up the yolks of four eggs, add half a teaspoonful of milk or cream to them, and stir in. Sweeten and stir till it thickens, but do not let it boil. Add the whites of the eggs whipped to a stiff froth to half a teaspoonful of cream, also whipped, and pile lightly on the top of the glasses to cool.

Nuts.—Even the common hazel nut will make an excellent dessert dish arranged on their own leaves, while few winter dessert dainties are nicer than a plate of freshly-roasted chestnuts. It may not be generally known that Brazil nuts can also be shelled and roasted like chestnuts. Dried and salted almonds are also an excellent addition to dessert. Spanish nuts may be dried in the same way. They should be rubbed in salt and placed in the oven till they get crisp, and of a light brown colour.

Olives, Stuffed.—Stone the required number of olives, stuff quite full with pounded anchovies and butter, and cook for five minutes in olive oil, drain and serve.

Peaches and Rice.—Boil some rice in milk slowly for an hour, and when it becomes quite firm add sugar to taste, and some essence of vanilla, two yolks of eggs; stir the fire till the eggs are set, then fill a mould. Stew some peaches for a tin for a few

minutes. Turn out the rice, dish up the peaches on it, and decorate with strips of blanched almonds.

Pears, Ginger.—Peel and core ripe pears, and cut into thin slices. Weigh the pears, and allow for four pounds of them the juice of two lemons, a gill of water, three pounds of sugar, and one pound of ginger root "cut into very thin slices. Put all, except the lemon-juice and fruit, over the fire, and heat until the sugar is dissolved, next lay in the pears, add the lemon-juice, and cook uncovered for an hour.

Pears, Small.—Boil a pint and a half of water with three pounds of loaf sugar to a syrup, peel the pears, and stew gently in the syrup until tender. Flavour with cloves, and place in jars with barely enough syrup to cover them, cover with bladder, and keep in a dry place for use.

Pears, with Rice.—Put four large pears, cut in half, in a stewpan with a pint of water and eight ounces of sugar; simmer gently until tender. Take out the pears, and let the syrup boil down to half, flavour with vanilla. Spread a teaspoonful of rice, nicely boiled in milk and sweetened on a dish, lay the pears on it, pour the syrup over, and serve.

Plum Charlotte.—Heat the plums, made sweet, very slowly. Cut four slices of light stale bread, and soak them in the juice. Cover the bottom of a mould with the fruit, and lay a slice of prepared bread on top, then another layer of plums, and so on, alternating until the receptacle is full, finally pouring the remainder of the juice over all. Cool, and serve with cream.

Prunes and Tapioca.—Soak half a pound of prunes in cold water, and next day remove the stones, add two ounces of sugar to the prunes, and boil them in the same water for half an hour. Stir in three tablespoonfuls of tapioca, and continue the boiling for another half hour. Turn the mixture into a pie-dish, and pour on it a custard made by mixing two eggs, one ounce of sugar, and half a pint of milk. Grate a little nutmeg on top of the custard, and cool for serving.

Rhubarb Fool.—Cut the rhubarb into inch lengths, cover the bottom of a saucepan with water; when it boils, put in the rhubarb, with the rind of a lemon cut thin and a little cinnamon. With plenty of brown sugar, let the rhubarb cook until soft, then strain. When cold, whip half a pint of cream, and stir lightly the pressed rhubarb. Serve with rice pudding.

Gingerbread.—Half a pound of flour, a quarter of a pound of raisins, two ounces of butter or dripping, two ounces of sugar, one tablespoonful of treacle, half a teaspoonful of buttermilk, one egg, one teaspoonful of ginger, one teaspoonful of spice. Rub the butter into the flour, add the dry things, and the raisins nicely prepared. Mix the treacle and the buttermilk together and stir them in, then the egg well-beaten; mix all together with a spoon, pour in a greased and floured cake-tin, and bake till ready.

Ginger Loaf.—To four pounds of dough add one pound of raw sugar, half a pound of butter, one ounce and a half of caraway seed, one ounce and a half of ground ginger. Bake in the usual way.

Girdle Cakes.—Half a pound of fine oatmeal, a teaspoonful each of sugar and baking powder, a pinch of salt, milk or buttermilk. Mix the dry ingredients, add enough milk to make a light batter, and bake in spoonfuls either in the oven, on a baking tin, or on a girdle.

Gravy.—Keep all scrapings of gravy from beef-steaks, all that is found under the dripping from a roast joint, etc. If you have nothing of this kind, you can always make some by taking some bones of cooked meat, breaking them small, covering with cold water, and stewing them slowly for two days. When cold, remove the fat, and you will have a nice gravy, as a foundation for hash or any made dish.

Gravy, a good Beef.—Cut up half a pound of beef into small pieces, and put it, with a pint of cold water, in a stewpan. Add chopped onion, half a teaspoonful of salt, pepper, a tablespoonful of sauce, and simmer gently for three hours. It must not boil quickly. Fifteen minutes before taking it up add half a teaspoonful of arrowroot, previously wetted with cold water, stirring all together. Boil and strain just before serving.

Gravy, Browning.—Into a pan, kept specially for the purpose (as the sugar will discolour it), put four ounces of granulated sugar, over a hot fire, stirring with a stick till very dark and almost at burning point. Then add quickly, still stirring, a cup of cold water. This is boiled up very slowly, and allowed to continue boiling for four or five minutes. Bottle and cork for use in browning gravy, sauce, or soup. It will keep good for a long time.

Gruel, to Make.—One tablespoonful of oatmeal, one pint of boiling water, two tablespoonfuls of cold water and sugar or salt. Mix the oatmeal smoothly with the two tablespoonfuls of cold water, then pour on the boiling water gradually, stirring all the time; put it into a small saucepan, bring it to a boil, and let it simmer for half an hour, stirring it very often to prevent its burning, and to make it smooth. Serve it with sugar or salt. If the oatmeal is very coarse, the gruel should be strained.

Haggis, Scotch.—Wash well the stomach of a sheep, turn it inside out, scald it, and put into salted water until wanted. Boil the liver, lights, and heart; mince them, and add half a pound of chopped suet, four minced onions, and half a pound of toasted oatmeal cakes pounded into powder. Season with pepper and salt, and stuff the "bag" with the various ingredients. Add a teaspoonful of good broth or gravy, and sew up. Put this into a saucepan (pricking the "bag" to keep it from bursting), with sufficient water to cover, and a plate under to keep it from sticking to the bottom. Boil for four and a half hours, keeping covered with boiling water.

HAM.

Ham and Eggs, Baked.—Cut some ham into small slices, partially cook, then drain the pieces carefully from the fat, and arrange them in the bottom of a well buttered dish. Cover the surface entirely with skilfully broken fresh eggs, sprinkle a little salt and pepper over the top, and bake in a moderate oven until the eggs are lightly set, then serve as hot as possible.

Ham Balls.—Take half an ounce of breadcrumbs, and mix with three-quarters of a pound of lean ham chopped fine. Beat two eggs, add to the ham, and form into balls with the help of a little flour. Fry in deep fat, and dry on paper.

Ham, Boiled.—Ham requires longer to boil than beef or mutton, and if long cured, it must be well soaked before boiling. Put the ham into a good-sized pot, and let it come slowly to the boil. Then allow it to boil quickly, and when done, draw off the skin, rub with sugar, and place before the fire to brown.

Ham Cakes.—Mince cold boiled ham very finely after removing all gristle, skin, and fat. Add a little cayenne pepper, and pound in a mortar with butter, when quite smooth, form into small cakes a quarter of an inch thick; cover with mashed potatoes, and fry in boiling fat. Soaked breadcrumbs may be mixed with the ham if preferred.

Ham, Potted.—Mince cold ham, and mix it with a dash of cayenne, grated nutmeg, and mace. Press into a buttered pie-dish, put greased paper over the top, and bake in the oven for twenty-five minutes. Then put into jars, with a sufficient layer of clarified butter, and put away to cool before use.

Hare, Jugged.—When the hare is skinned, allow all the blood from the upper part of the body to run into a basin along with the liver and heart. Divide the hare into joints. Put these in a stewpot with water, and one onion stuck with cloves, a tiny bunch of herbs, a bay leaf, and a lemon rind. Stew gently for about three hours, and in the meantime mix the blood two tablespoonfuls of flour and a little vinegar. Boil this and strain. Parboil the liver and heart, pound them, and mix with some forcemeat, make into balls, and fry in boiling fat. Use these balls as a garnish. Add a glass of port wine to the jugged hare, and serve with red currant jelly.

Ham, a Cold.—Lady Chancery, writing in 1780, gave this quaint recipe:—"Take a turkey and let him be cold, then mince the white of him small, with

anchovy and oysters, so draw it out in the dish in flowers and lay it round with all sorts of pickles, and it is proper for the middle of the table."

Hash, a Savoury.—Dissolve two ounces of butter in a stewpan with a spoonful of red currant jelly. Place slices of cold mutton in this, turn and heat slowly, not letting it get crisp. Place some hot, finely-chopped spinach on a hot dish, and arrange the meat on it. Add a tablespoonful of vinegar mixed with a little dry mustard, lemon juice, and some gravy. Stir, thicken with cornflour, season well, and pour around the mutton and spinach.

INVALIDS, COOKERY FOR

Invalid Beef Tea.—Mince lean gravy beef. Put it into a jar, cover it with water, add a little salt, and stir it with a spoon. Cover and put the jar into a saucepan with the water reaching to the middle of the pot, and steam for four hours and a half. See that the water does not dry up in the vessel. Strain carefully before serving to the patient.

Invalid Custard.—Where eggs may be given the following forms a nice change for the invalid from ordinary beefsteak, and is usually much appreciated. Beat up two yolks and one white of new laid eggs, a pinch of salt, and a small cupful of beef-tea made either from fresh beef or any good essence, put into a small basin, and steam it over a saucepan much smaller than the basin, so that the latter will not touch the bottom of the saucepan. The water should only simmer. The custard may be baked by putting it in a small dish, and placing in the oven till set.

Invalid Blancmange.—Boil an ounce of the best isinglass, with a stick of cinnamon, in half a pint of water. In half an hour the isinglass will have dissolved and become a very thick jelly-like substance; then mix to it a pint of new milk, and loaf sugar to taste. Let it boil up once, and then strain into a basin. When nearly cold, pour it into a mould. It should turn out a beautiful white jelly, like marble.

Invalids, Eggs for.—Bring the water to the boil, then take the saucepan off the fire, and place the egg in it for five minutes. This will cook the egg perfectly without hardening the white.

Invalids' Pudding for Christmas.—Five ounces of bread crumbs, three ounces of caster sugar, three ounces of suet, half a pint of milk, three ounces of candied peel, one ounce of lump sugar, and of one lemon grated, yolks only of two eggs. Mix bread crumbs, peel, rind, suet, and caster sugar. Place loaf sugar and a teaspoonful of water in saucepan over fire, stir until dark colour, add milk, and let boiled sugar dissolve in it. When cold pour this gradually to yolks of eggs, straining all then; add a little sherry or extra milk, steam for one and a half hours, and serve with a white sauce. This being devoid of suet will allow invalids to partake of Christmas pudding without injury.

Invalids' Pudding, Handy.—One egg, a third of a pint of milk, one-eighth of an ounce of gelatine, and an ounce of lump sugar. Beat up the yolk and the white of the egg separately, and soak the gelatine in enough milk to cover it until it is swollen. Then add the egg yolk and sugar. Boil the rest of the milk and pour it over the gelatine and sugar as soon as they are ready. Stir well, and let the mixture come to the boil, then pour on to the previously well-whipped white of egg. Mix thoroughly, and pour it into a mould. Do not disturb until cold, when it will be ready to serve.

JAMS.

Jam, Blackberry (Spiced).—Make a syrup of two pounds of light brown sugar, one pint of best cider vinegar, and one teaspoonful each of ground cloves and cinnamon. When boiling, put in six pounds of blackberries, and let simmer very gently for fifteen minutes. Seal, boiling hot, in pint jars.

Jam, Cherry.—Take good sound cherries, and remove the stones; put the cracked stones in a small pan and boil them for half an hour, and strain; then take one pound of sugar to one pound of fruit and half a teaspoonful of the water the cherries were boiled in; if necessary, make up the water with a little red currant juice; boil the sugar and water for ten minutes, then

put in the cherries, and boil for about forty minutes till it jellies.

Jam, Cranberry and Apple.—Cranberries one quart, one and a half quarts of sweet apples, two-thirds of a quart of cold water, two and a half pounds of sugar. Put sugar, water, and cranberries on together; boil until the cranberries begin to crack; add the apple and boil slowly until soft. Bottle for use.

Jam, Damson.—Allow a pound of sugar to each pound of fruit. Wash the damsons and dry them well in a towel. Put a large cupful of water and the same of sugar into the preserving pan, and when melted put in a third of the damsons and a third of the sugar. When that melts, put in half of what remains; let that melt before adding the rest. Let it simmer slowly for half an hour, then boil quickly for a quarter of an hour, pour into jars, and leave them undisturbed for two days before tying down.

JELLIES.

Jelly, Apple.—Pare, core, and slice the apples. Boil the slices in a little water till they are pulpy; strain them through a hair-sieve; that which runs through is to be used. Take one pound of lump sugar for each pint of juice, and boil for twenty minutes. The juice of a lemon with a bit of sugar may be boiled along with it. Pour into jars, and cover tightly when cold.

Jelly, Calves' Foot.—Put two prepared calves' feet into a pan with two quarts of water, and let it boil steadily but gently till the liquid is reduced to half. Then strain and leave till stiff, remove all fat by pouring a cupful of boiling water over it, and placing a sheet of clean blotting paper on the top after skimming. Take one and a half pints of this stock, free from any fat or sediment. Put it into a pan with the strained juice and thinly-peeled rinds of two lemons, a glass of sherry, three ounces of pounded loaf sugar, and the whites and crushed shells of two eggs. Whisk all these ingredients over a gentle heat till the liquid boils up to the top of the pan, let it sink and reboil twice, then draw the pan to the side of the fire, and let it stand for ten minutes. Wring out a jelly bag in hot water, let the jelly run through, and pour into shape to mould.

Jelly, Coffee.—One teaspoonful of very strong coffee and an ounce of gelatine are required. Dissolve the gelatine in the coffee. Put into a saucepan one pint of milk and eight ounces of lump sugar. When nearly boiling pour in the coffee and gelatine. Boil together for ten minutes and pour into a wetted mould; set it in a cool place till stiff.

Jelly, Crab Apple.—Cut the apples in sections, well pared and cored, and put in a jar. Place the jar in a saucepan of boiling water, and let it simmer until the juice is well drawn from the fruit, then strain. Measure the juice and allow to each pint a pound of loaf sugar; put these in a preserving pan, set it over the fire, and keep stirring for about half an hour removing the scum as it rises. When a little jelly put on a plate, cools firm, it is done. Pour into pots cover with oiled paper. Store in a dry place.

Jelly, Cranberry.—Allow a cupful of water to a quart of berries. Boil until soft. Turn into a cheesecloth bag to drain. Allow sugar in equal measure to the juice. Boil fifteen minutes, removing the scum when it thickens on the spoon turn (hot) into the glasses.

Jelly, Currant.—Pick stalks from fine, large red currants, put them in a preserving pan over a moderate fire, and crush with wooden spoon till juice is extracted. Strain through a jelly-bag, and to every cupful of juice add half a pound of sugar. Put juice and sugar back in the pan and gradually boil. Let it boil for about ten minutes, and then, when a little cool, turn into glasses or moulds. Turn out when cold.

Jelly, Strengthening.—Put one ounce each of sago, ground rice, pearl barley, eryngo-root, and gelatine, previously soaked in cold water; boil gently till reduced one-half. Strain and set aside. A few spoonfuls may be dissolved in broth, tea or milk.

Kedgeree.—Pick cold cooked fish from the bones, chop it, add two hard-boiled eggs, and mix well

together. Now take a teaspoonful of well-boiled rice, seasoned with white pepper, a dash of cayenne and salt. Put all into a saucepan, with two or three ounces of fresh butter cut in lumps. Stir it all over the fire, and serve hot.

Ketchup, Cranberry.—Take five pounds of cranberries, one pint of vinegar, two and a-half pounds of sugar, three dessertspoonfuls of cinnamon, two of allspice, one of cloves, one of salt, and a little cayenne. Boil slowly one hour and bottle.

Ketchup, Elderberry.—Pour a gallon of water over a gallon of ripe elderberries (with stalks already picked) in a large jar. Place it at the back of the range to remain all night. Then drain off the vinegar, add three ounces of shallots, one ounce of root ginger, one tablespoonful of cloves, two blades of mace, and one tablespoonful of pepper. Boil for twenty minutes, stand for twenty-four hours. Strain and bottle.

Ketchup, Mushroom.—Large flap mushrooms arranged in layers sprinkled with salt in a earthenware pan, and dried in several consecutive days, should be stewed in close jars for two hours with allspice and seasoning, the liquor passed through a hair sieve, and then boiled gently for half an hour, cooled, bottled and sealed, storing therefor in a cool place.

Ketchup, Tomato.—Quarter ripe tomatoes, lay on a dish and sprinkle with salt. Next day drain away the juice, strain it, and boil for half an hour with capsicums and shallots; pulp the tomatoes, pass through a fine sieve, boil with the juice for a further half hour, and bottle off hot, sealing tightly.

Kidney, with Haricot Beans.—Wash one pound of haricot beans, and leave them soaking for twelve hours. Place them in a deep earthenware pan with a quart of water and some salt, in a good oven. When half the water is absorbed cut the kidney into pieces about one and a half inches square, and add it to the beans. Add also three carrots, three ounces of butter, herbs, celery, pepper, and a pinch of mustard. Cover the dish and replace it in the oven, to simmer for an hour and a-half. Remove the herbs before serving.

Kidney, with Tomato Sauce.—Cover the halved kidney with flour, and fry in butter, with a finely-shredded shallot. Simmer this in a saucepan for one hour, with half a pint of tomato sauce, a sprinkling of mixed herbs and pepper and salt. Thicken with butter and flour, add a little gravy colouring and the juice of half a lemon. Serve hot.

LAMB.

Lamb and Cucumbers.—Peel three cucumbers and remove the seeds. Put them into a quart of water with salt and vinegar; let them stand for three hours, then drain off the liquid. Work a quarter of a pound of butter into a tablespoonful of flour, add a pinch of cayenne and a teaspoonful of sugar, then shake swiftly over a fire until it is of a pale yellow colour. Add the cucumber, and cook gently for twenty minutes, shaking the pan at intervals. Then put in one gill of white stock and cook for ten minutes more. Add the juice of one small lemon, and serve over well-seasoned lamb cutlets.

Lamb, Braised Breast of.—Remove the skin from the breast of lamb and put the meat into boiling water for a few minutes. Take the meat out and let it cool, then put into a pan with about half a pint of stock, some thin slices of lemon peel, and a few slices of bacon. Add pepper and salt, two chopped onions, a bay leaf, and a few carrots. Parsley, thyme, mint, or any savoury herbs you like may be added to give it a flavour. Simmer gently until tender.

Lamb, Roast Breast of.—Put a nice breast of lamb into a saucepan with hot salted water, and bring to the boil. Boil for ten minutes, take the meat out, well dry in a cloth, put in a Dutch oven, and roast before a clear fire until nicely browned all over. Serve on a hot dish with new potatoes, with mint sauce.

Lamb, Roast Neck of.—Roast a neck of lamb. Melt in a stewpan one ounce of butter, put in a score of small onions, two carrots cut into thin slices, two turnips similarly treated, a teaspoonful of brown sugar,

pepper and salt; in when the butter is all absorbed, add half a pint of good brown gravy and a little parsley. Stew gently till the vegetables are tender; dish with the roast lamb, and some baked potatoes on top.

Liver, to Fry.—Cut it into slices a third of an inch thick. Put them into a pan of boiling water, and let them stand for five minutes. Then dry in a clean cloth, dredge thickly with flour, pepper and salt, and fry until brown in dripping or butter. Parboil and finely chop some onions, and when the liver is partly done put in the onions, which should have been drained dry, and fry brown. When cooked through set it on a hot dish, make a good gravy, and pour over all.

Macaroni and Cheese.—Throw some macaroni into boiling water, add some salt, and let it cook thoroughly. Well butter a pie-dish, arrange the cooked macaroni neatly therein. Dust with pepper, pour round it a large cupful of well-made white sauce, into which has been mixed three ounces of grated cheese. Set the run well arranged the macaroni, and shake over all a liberal coating of grated cheese. Heat it in the oven, and brown the surface by passing a red-hot iron about half an inch above it; serve immediately.

MADE DISHES. (See also Moulds.)

Brawn.—Wash a pig's head and feet, then place in boiling water along with a shin of beef weighing about one and a half pounds. Boil for two and a half hours, lift from the water, remove all bones and chop fine. Mix a tablespoonful of salt, a teaspoonful of white pepper, a dash of cayenne and a spoonful of mixed spices. Add to the brawn and mix all thoroughly. Run a mould with cold water, press in the brawn and place a weight on top. Turn out when solid.

Brawn, Ox-cheek.—Clean, removing all small bones, soak in salted water for two or three hours, wash again and put to boil. Then add two or three carrots, turnips and onions, thyme and parsley, peppercorns, two teaspoonfuls of salt, and mix all thoroughly. Gently boil until the meat will leave the bones, about four or five hours. Then remove the bones, and when cold cut the meat into small pieces. Well wet a basin, put some pieces of hard-boiled egg on the top, fill in with the cheek about half-way up. Dissolve an ounce of gelatine in some of the liquor, let it boil season, strain and fill up the basin or mould.

Marmalade, Orange.—Boil the oranges in water until the rind can be pierced with the head of a pin. When cold cut the fruit in quarters, and with a spoon take out the pulp and juice, carefully removing all pips and white skin. Cut the peel in thin strips and add double the weight in sugar, thoroughly clarified, adding three-quarters of a pint of water to each pound of sweetening. Boil all up for thirty-five minutes, and place into sealed jars for use.

Mayonnaise, Cucumber.—Take half a pint of salad oil, the yolk of a raw egg, and a little salt, pepper, and vinegar or lemon juice. Set the bowl in which the mayonnaise is to be mixed in a basin of ice, to make the ingredients blend perfectly; put in the egg yolk, half a teaspoonful of salt, a little pepper, a dash of cayenne, and a half teaspoonful of vinegar; mix to a smooth cream, then begin to stir in the salad oil until a thick paste is formed, stir in vinegar slowly until the sauce is creamy, then stir in more oil gradually until it is thick again. Proceed in this way until the oil is all used, taking care that the sauce is not too thin. When done add two or three tablespoonfuls of grated cucumber.

Mayonnaise of Vegetables.—Take new potatoes, green peas, artichoke bottoms, cut small and cooked, pile tastefully on a dish and cover with mayonnaise sauce, arrange little bunches of chopped lettuce, celery, tomatoes, beetroot, &c., sprinkle a little tarragon, chervil, and young onions around the border.

Meringue of Rhubarb.—Weigh a pound of young rhubarb stems after they have been carefully pared and cut in lengths; mix eight ounces of pounded sugar with them and stew gently until they form a

smooth pulp, then quicken the boiling; stir often until stiff, then turn from the pan, and stand until quite cold. Whisk the whites of four fresh eggs to a solid froth. No drop of liquid must remain at the bottom of the basin. After this mix gently with it four tablespoonfuls of dry sifted sugar, stir gently together, and lay lightly over the meringue in a rather deep tart-dish. Place the meringue in a moderate oven, and bake for about half an hour.

Mincéd Beef and Tomatoes.—Cut four good-sized onions into rings, slice half a pound of tomatoes, and fry in beef dripping seasoned. Mince one pound of beef, put it into a saucepan with the onions and tomatoes. Let it come to the boil, then remove the pan to the side of the fire, and simmer for half an hour. Thicken and make a wall of mashed potatoes, put the mince in the middle, and serve.

Mincéd Mutton.—Finely mince the meat, free from fat and skin, season well with salt, pepper, and a little piece of clarified butter. Put into some nicely flavoured stock, with the yolk of an egg well-beaten. Turn into a stewpan, and gradually warm without boiling. Stir constantly. Boil and mash some potatoes, season, and place round the dish that the mince is to be served on. Pour the mince in the centre, scatter over all some finely-minced parsley, and take hot to table.

Mincement for "Faggots."—A savoury "Faggot" may be made of a mincemeat of liver, and fresh fat pork. Finely chop one and a half pounds of fresh pork. Season the mince with onion, sage, salt, thyme, and pepper. Steam it over boiling water, and throw off all fat. When cold add a large cupful of breadcrumbs and three well-beaten eggs. Mix all together thoroughly, flavour, make into round balls, and bake in a greased dish with a little good gravy.

Mincement, Vegetarian.—One pound of currants, half a pound of stoned and chopped raisins, half a pound of sugar, four ounces of brown breadcrumbs, three oranges and three lemons, a pound of apples a little spice, a quarter of a pound of mixed peel, half a pound of marmalade, salt, and half a pound of any kind of nuts. Cut off thinly the rind of the oranges and lemons, boil them in sufficient water to cover, and when quite soft, chop and mix them with the other ingredients, all prepared and mixed previously, moistening with a little of the water in which the rinds were boiled.

Mould, Fish.—Take away all bones and skin from any cold cooked fish, and chop into small pieces, mixing in pepper, salt, and finely-chopped parsley. Butter some small moulds, and sprinkle with finely-chopped parsley. Put the fish lightly into moulds; make a stiff sauce with two or three eggs well beaten and a very little milk, and pour slowly in to fill up the cups. Cover each with buttered white paper. Stand the cups in a pan of boiling water three fourths up their sides, and steam until set. Serve hot after carefully turning out, with suitable sauce.

Mould, Lemon.—Boil a pint of water in half a pound of sugar, and the finely-grated rind of two lemons. Beat together the yolks of two eggs and the white of one, and stir in gradually two ounces of corn-flour and one tablespoonful of butter. Boil all together for five minutes. Place in a well-scrubbed mould, and let it stand for four hours. Turn out, and before serving whip up the whites of the other egg, and pile lightly on the top.

Mould, made from an old Fowl.—A good way to cook it is to boil it gently till the flesh slips from the bones. Place the pieces of meat into a flat mould, and lard with hard-boiled eggs. Scum the fat from the broth, add half an ounce of gelatine powder, a little tarragon vinegar, mace, pepper, and salt. Strain this over the fowl whilst still warm. Put on ice, and serve cold, whole or cut in slices.

Mould, Ox-Foot.—Boil an ox-foot in three pints of water, with a blade of mace, two bay-leaves, twelve peppercorns, four cloves, an onion, and a slice each of carrot and turnip. Boil until the foot separates. Mince two pounds of cooked beef, and cut a pound of cooked ham into dice, season well, and lay in a mould that has been ornamented with hard-boiled yolk of

egg. Strain the liquor from the ox-foot, and pour it into the mould. Turn out carefully when cold.

Muffins.—To every pound of flour mix one egg, one ounce of butter, and two tablespoonfuls of yeast. Melt the butter in half a pint of milk. Beat the mixture thoroughly, and set it to rise for two hours. Form into cakes and bake on a griddle. When the bottoms are brown, turn and bake on the other side.

MUTTON.

Mutton Chops, Sauté.—Slice thinly one small onion and one small carrot. Put these in a pan where butter is already melting. Add water, and boil for about three-quarters of an hour. Remove the onion and carrot and season with pepper and salt. Put in the chops and cook gently for fifteen minutes, stirring the sauté well all the time.

Mutton, Curried.—Put four ounces of butter into a stewpan with four minced onions, then add an ounce of curry powder, a teaspoonful of salt, a dessert-spoonful of flour, and half a pint of cream, stirring it until smooth. Gently fry two pounds of mutton, cut in small neat pieces, to a light brown colour. Lay the meat in a stewpan and pour the sauce over it, and simmer it very gently until the meat is quite tender.

Mutton Cutlets, with Chilies.—Work together two teaspoonfuls of chopped green or red chillies, two teaspoonfuls of butter on a plate with a knife. Add half a teaspoonful of made mustard, grated horseradish, and a teaspoonful of walnut ketchup. Spread some of this mixture over each cutlet. Have some nicely-mashed potatoes in the centre of a hot dish, and place the cutlets around, with slices of lemon.

Mutton, Devilled.—Slice the meat neatly to equal sized pieces, and marinate them for an hour or so in a mixture of two tablespoonfuls of oil, a teaspoonful of vinegar, a sprig of parsley, two or three peppercorns, and a medium-sized shallot, sliced; now drain, and roll the slices in breadcrumbs mixed with cayenne pepper, broil these slices over a clear fire, and serve with sharp sauce.

Mutton, Fillet of (Boiled).—Remove the bones from the thick end of a leg of mutton, and fill the cavity with some nicely-seasoned veal stuffing. Roll out some light sweet crust, season the joint all over with salt, pepper, and chopped onion, and put the meat in the sweet crust, wetting the edges with cold water to prevent the juices of the meat escaping. Wrap all this in a damp and floured cloth, and drop into fast boiling water. Cook until the meat is tender, allowing twenty minutes for each pound of meat, and a quarter of an hour extra for every four pounds. Turn the meat out of the cloth, sprinkle with brown breadcrumbs mixed with chopped parsley and serve. Nice rich gravy will pour out when the crust is cut.

Mutton, Fillet of (Stewed). Have ready a half leg of mutton, and take the fillet end. Cut two slices off it about half an inch thick, rub butter and pepper on it, and put in a stewpan with just enough water to cover the two fillets as they lie flat. Add a little onion and chopped carrot, and simmer gently for thirty minutes or a little longer. Take up the fillets and brown them before a brisk fire. Strain the gravy and thicken it.

Mutton, Leg of, with Capar Sauce.—Wipe the leg with a damp towel, put into a kettle, cover with boiling water, and simmer gently for fifteen minutes to every pound. Add a teaspoonful of salt. When done, take up, lay the joint on a heated dish, garnish with parsley, and serve with capar sauce.

Mutton, Roulades of.—Cut some underdone or raw mutton into pieces about three inches long by one and a-half inches broad without fat. Season and put a few capers on each piece, which then roll up and run on a skewer. Place in the oven on a baking-dish with just enough water to cover them, and bake for about half an hour. Slip the roulades off the skewer, and serve with capar sauce, made thick, and mashed potatoes.

Mutton, Saddle of.—Remove any superfluous fat from the saddle, lightly sprinkle the meat with a mixture of two ounces of salt, half an ounce of pepper,

and a quarter of an ounce each of ground cloves, mace, and nutmeg. After twenty-four hours wash off the spices, dry the meat thoroughly, and roast in the usual way, basting constantly with one and a-half pints of stock. Serve with red currant jelly, potatoes, and nicely boiled vegetables.

Mutton, Braised.—Season two cupfuls of chopped-up mutton, add two tablespoonfuls of gravy and half an ounce of butter. Put all into a small saucepan. When the meat is hot, add three slightly-beaten eggs; stir, and when the eggs stiffen, place on slices of buttered toast and serve very hot.

Mutton, Shoulder of (Boiled).—Hang a shoulder of mutton, until tender, and salt it for two days; turn it and sprinkle it with pepper and mace. Lay some of a dozen and a-half of oysters inside the joint, roll it up tightly, and tie together. Then put it in a stewpan with enough water to cover it, put on the lid of the pan and fasten firmly. Stew the remaining oysters in the gravy, which must be thickened with a little flour and butter. When the meat is cooked remove the tape and pour the gravy over it.

Mutton, Shoulder of (Stuffed and Braised).—From a small shoulder extract all the bones. Make the stuffing by mixing together three tablespoonfuls of bread crumbs, three ounces of bacon, some mushrooms, one small onion and parsley chopped fine, a teaspoonful of powdered herbs, and seasoning. Add one beaten egg to bind the ingredients together. Stuff the spaces caused by the removal of the bones with this, and roll up tightly. Cut up in large pieces a carrot, onion, and turnip, and place these in a stewpan with some parsley and herbs and the bones taken from the shoulder and about two quarts of stock. Simmer for about two hours. Take out the meat, and, when cold, brush over with melted glaze, and garnish with pieces of the cooked vegetables.

Mutton, Steamed.—Put a small piece of mutton into a pudding basin, dust with pepper and salt, and put the basin into a saucepan with boiling water to come half-way up the basin. Put on the lid, and keep the water boiling, adding to it as it boils. Allow half an hour to each pound of meat. Add any bottled sauce preferred to the gravy found in the basin, or the gravy alone may be thickened with flour.

Mutton, Stewed.—Buy the lean end or scrag of a neck of mutton, and have it well cracked but not divided. Put into the stewpan with cold water to cover it, sufficient salt and two onions cut in halves. When on point of boiling add a cupful of tapioca soaked overnight. Let them simmer together till cooked. Put the meat into a dish, pour the liquor with the tapioca around.

OMULETTES.

Omelet, Asparagus.—Boil and chop the tender part, and beat up with four eggs. Put three ounces of butter into a perfectly clean omelet or frying pan. When it is hot, add salt and pepper, beat up well, pour into the pan, and fry quickly, turn over, and send to table as soon as possible.

Omelet Cheese.—Beat together thoroughly two eggs, a pinch of salt, pepper, half a teaspoonful of finely chopped parsley, and double that quantity of grated cheese. Dissolve butter the size of an egg in a frying pan and fry quickly and carefully.

Omelet, King's.—Mix two tablespoonfuls of flour, three ounces of sugar, yolks of two eggs, one breakfast-cupful of milk in a pan, and stir until it thickens over a slow fire. When cold, whip the whites of the eggs to a froth, mix all together lightly, and fry like pancakes. Put apricot jam between.

Omelet, Savoury.—Beat up three eggs with a little salt and a teaspoonful of finely minced parsley. Have ready a clean pan (only used for omelets), and melt in this some butter allowing half an ounce for each egg, and when quite still and beginning to colour, add in the egg mixture, let it stand for a minute or so on the fire, then carefully tilt the pan a little, slip a broad bladed knife underneath, and let the uncooked egg run under, repeating this till there is no more liquid, slip the knife under, and turn it on to a hot plate, serving at once.

Omelet, Tapioca.—Soak two ounces of tapioca for an hour, boil gently for thirty minutes, adding salt;

stir in one pound of breadcrumbs, two ounces of boiled and finely chopped onions and thyme. Beat all together and bake.

Omelet, Tomato.—Cut three or four ripe tomatoes into pieces, and cut an onion into the thinnest slices possible. Melt a teaspoonful of butter in a pan, and cook the onion and tomato for ten minutes. Keep the mixture hot and pour it over the surface of an ordinary omelet just as you are turning it out of the pan. The omelet will roll over of its own accord, enveloping the tomatoes as it passes into the dish.

Pancake, Beef.—Make a thin pancake, spread it out, cut into pieces two inches wide and three inches long, and upon the surface of each place a very thin slice of bacon slightly smaller than the cake. Over the bacon put a tablespoonful of minced beef worked into a cold sauce to give it moisture and cohesion. Roll up your pancakes, put them on a buttered tin, brush them with a whipped egg, breadcrumb them, and bake brown in the oven.

Pancakes, French.—Half a pint of milk, one egg, two tablespoonfuls of flour, half a teaspoonful of sugar. Beat up the sugar and egg. Add the flour and milk. Butter two saucers and divide the mixture, and bake in a moderate oven for twenty minutes. Remove from the saucers and put jam between them.

PASTRY.

Cheesecakes, Apple.—Peel, core, and skin one pound of apples, and cook in a little water until soft enough to crush. Add six ounces of butter and four ounces of castor sugar. Stir one way until the butter is melted. Pour into a basin, add the grated rind and juice of two lemons and four well beaten eggs, and stir with a wooden spoon until well mixed. Line small tins with pastry before putting the mixture in. Bake for a little over a quarter of an hour in a hot oven.

Cheesecakes, Curd.—Warm a pint and a half of new milk, and curdle with a dessertspoonful of rennet. Drain the whey away through muslin. Add to the curd one beaten egg, a dessertspoonful of brandy, sugar, chopped peel, and currants to taste. Line patty pans with good paste, put some of the mixture in each, and bake till a golden brown.

Pastry Making, Flaky.—Into a basin put a pound of flour, rub into it a quarter of a pound of butter, mix cold water into it until an elastic paste is formed; roll out, and put a quarter of a pound of lard on it in little balls; fold in three, let it lie in a cool place for ten minutes, roll it out again, and put on in the same way a quarter of a pound more lard. Fold it and put away again for fifteen minutes or more; it is then rolled out and ready for use.

Pastry, Making Puff.—Mix one pound of flour to a smooth paste with not quite half a pint of water, then roll out three times, the first time covering with four ounces of butter, the second with four ounces of lard, and third with four ounces of butter. Bake in a quick oven.

Pastry, to Glaze.—To glaze pastry for raised pies, break an egg, separate the yolk from the white, and beat the former for a short time. Then, when the pastry is nearly baked, take it out of the oven, brush over with the beaten yolk of egg, and put back in the oven to set the glaze.

Pastry, to Prevent Burning.—(See "Kitchen Notes," Introductory.)

Roll, Swiss.—This requires four eggs, one cup of sugar, one cup of flour, and one teaspoonful of baking powder. Beat the eggs well, then add the sugar and flour, with which the baking powder has been sifted, and a little milk. When baked, spread with jam, and roll.

Art, Apple.—Peel, core, and slice some good cooking apples. Line a pie-dish with light, short paste, and cover the bottom with the apples as thickly as possible. Sprinkle with sugar, a little ground cinnamon, and the grated rind of a lemon. Cover thickly with sponge-cake crumbs, and bake until the apples are tender.

Tartlets, Macaroon.—Place in patty pans lined with thin paste a teaspoonful of raspberry or

strawberry jam. On the jam place a mixture made by forming into a firm paste two ounces of ground almonds, one egg, and four ounces of caster sugar. Over this arrange crossed strips of pastry. Bake in a good oven, and serve cold.

PICKLES.

Beetroot.—Take freshly dug beetroots, and after gently washing off the soil so as not to break the skin nor any of the tendrils, boil tender; peel, cut in slices, and put into jars. Boil enough vinegar to cover the beetroots, allowing to every quart half an ounce each of bruised ginger, peppercorns, mace, salt, and cloves; when flavoured, strain, cool, and pour into jars, which should be tightly covered.

Chow-Chow.—One half peck of green tomatoes, one large cabbage, and seven onions. Chop, mix well with salt, stand overnight with one ounce of celery seed, a quarter of a pound of white mustard seed, a quarter of a teaspoonful of ground pepper, a quarter of a teaspoonful of cinnamon, and one gill of grated horse-radish. Roll three quarts of vinegar and two pounds of brown sugar, and when boiling hot pour over the mixture.

Onions.—Peel the onions, and stand in salted water for a couple of days. Strain the onions, and bottle them. Boil vinegar, in which is placed peppercorns, ginger, and allspice. When cooled a little, pour over the onions in the bottles. These will be ready in about a fortnight.

Piccalilli.—Add one ounce and a half of white scraped ginger to two quarts of vinegar, one ounce each of pepper and turmeric, one and a half ounces of salt, two ounces of peeled shallots, the same of peeled garlic, and a dessertspoonful of dry mustard. Infuse these in a stone jar, closely covered, for a week in a warm place. Then prepare the cauliflowers by picking off the green leaves, plunging in strong boiling brine for seven or eight minutes, then dip in cold water, drain and dry. Boil up the pickle and cool. Trim the cauliflowers into neat pieces, fill jars with these, and pour over the cooled pickle.

Red Cabbage.—Remove the outer leaves, and cut the hearts crosswise in very fine slices, the finer the better; spread these out on a large shallow dish, sprinkle freely with salt, and leave in a cool place for twenty-four hours, after which drain away all the liquid, place the cabbage in jars, cover with cold vinegar, which has been boiled gently for about ten minutes with ginger and peppercorns in the proportions already given for onions, and tie down securely.

Shallots.—To each quart of vinegar add two teaspoonfuls of allspice and two teaspoonfuls of whole pepper. Take off the fine outside skin, when the bulbs will look quite clear. As fast as peeled put in dry bottles or jars. Pour over sufficient cold vinegar to cover, with pepper and allspice. Tie down, and in a fortnight they will be fit for use.

PIES.

Pie, Apple (Banbury).—Butter a pie-dish, peel and core some juicy apples; put a layer of apples in the dish, with a thick layer of chopped mixed candied peel, nicely-cleaned currants, a little ground cinnamon, and ground ginger. Pour over this a little warm butter, then fill up the pie-dish with further layers of apples, candied peel, currants, and flavoured. Add a teaspoonful of boiling water, and a teaspoonful of sugar; cover the pie with a nice short paste, bake in a hot oven for three-quarters of an hour. Brush the paste with milk, sprinkle freely with sugar, and set the pie in the oven for a few minutes to glaze.

Pie, Calf's Head.—Boil a calf's head until tender, then cut the meat in thin slices. Make stock from the bones, skimming carefully, and flavouring with vegetables, herbs, &c. Next day have some slices of hard-boiled egg, and lay them in the bottom of a greased dish. On these put alternate layers of meat and jelly till the dish is full. Cover with some good puff paste, and bake till the pastry is done. When cold, cut off the pastry and turn the contents of the pie upside down carefully on to a cold dish.

Pie, Game.—Cut one partridge, one pheasant, one

grouse, and a portion of hare into neat joints, and season liberally, adding parsley and a shallot. Line a deep pie-dish with thin and well-seasoned slices of veal and ham, then lay in the game, some quarters of hard-boiled egg, and some forcemeat balls. Pour some good stock over, cover with crust and bake.

Pie, GIBLET.—Put two or three sets of giblets into a stewpan and boil. Skim, and salt, and simmer gently for two hours. Cut the giblets when tender into uniform pieces, and dip each into flour seasoned with pepper and salt. Then lay in a pie-dish with half a pound of steak cut into pieces and rolled in the seasoned flour. Pour in sufficient stock to cover. Top with sliced hard-boiled eggs and chopped parsley, then add a good crust and bake.

Pie, Lemon (American).—Line a pie-dish with short crust. Put a tablespoonful of cornflour into a basin, moisten it with cold water, pour a cupful of boiling water on it, and stir till slightly thickened; add the rind and juice of a lemon, one ounce of butter, two ounces of sugar, and one beaten egg; pour into a pie-dish and bake in a moderate oven. Serve cold, with sifted sugar over.

Pie, Mutton.—Remove all skin and fat from scraps of mutton. Parboil half a pound of potatoes, and chop an onion and a little parsley. Grease patty pans, and line them with nice puff paste. Fill with equal quantities of meat and potatoes well seasoned. Cover with pastry and bake for a few minutes in a hot oven, then stand on a cooler shelf that the meat may stew nicely.

Pie, Rabbit.—Lay in a pie-dish a rabbit, cut into neat pieces, and rolled in flour, add small slices of bacon, chopped onion, grated nutmeg and seasoning to taste. Top with a layer of sliced potatoes, pour in half a pint of water, cover with a good crust, and bake.

Pie, Steak and Kidney.—Cut the steak and kidney into neat pieces, add water to cover, boil, then simmer gently for an hour. Thicken with flour, add pepper, salt, a little nutmeg, and a little good bottled sauce. Put all this in a pie-dish, and cover with good paste. Brush over with yolk of egg, and bake until the paste is done.

Pie, Veal and Ham.—Cut veal into small pieces, put a layer at the bottom of a pie-dish, and sprinkle over the meat a little pepper and salt, grated lemon-rind, powdered mace, and mixed herbs. Lay over these two slices of lean ham or streaky bacon and some slices of hard-boiled egg. Repeat alternately till the dish is full. Pour in a little meat stock; line the edge of the dish with pastry, cover with the same, and bake the pie in a hot oven till done.

Pie, Vegetable.—Take equal quantities of carrots and turnips, one head of celery, two onions, and two ounces of dripping. Cut the vegetables in pieces about one inch long, place them in a saucepan with the dripping and a small quantity of water. Season with pepper and salt to taste. Stew gently over a slow fire, and when tender pour into a pie-dish. After cooling cover with paste and bake. This should be eaten hot.

PORK.

Pork Chops, Baked.—To each chop allow a small onion and a small apple. Skin the onions, slice thinly and spread over a baking-tin. Arrange the pork chops on the onions, with pepper and salt. Peel and core the apples, slice, and put over the chops. Place a few small pieces of butter on the sliced apples, and bake in a brisk oven for half an hour.

Pork, Boiled.—Boil a piece of salt pork, allowing half an hour to one pound and half an hour over. Make melted butter sauce, sprinkle in powdered thyme, pour over the pork, and serve.

Pork, Leg of (Boned).—Have the bone removed from the leg, and fill up the space with forcemeat, composed of breadcrumbs, sage, allspice, pepper and salt, and a little onion chopped finely. Roll it up tightly, roast gently, basting it with butter and flour shortly before serving with apple sauce.

Pork, Loin of, Baked.—Soak a fresh loin of pork for a week in red wine flavoured with garlic. Then hang it up in a moderately warm place to dry. When required for cooking, return it first to the wind-pickle for a few hours, dry it, sprinkle with chopped

sweet herbs, wrap in bay leaves, and bake with the strained pickle, and the juice of two Seville oranges.

Porridge, Wheatmeal.—Put one quart of water in a clean pan. Add to it a level teaspoonful of salt. Bring it to the boil. Shake in gradually half a pound of wheatmeal. Boil gently about ten minutes. Stir frequently. Serve hot, with cream, sugar or syrup.

POULTRY.

Chicken, Braised.—Put two gammon rashers at the bottom of a braising pan, lay a jointed chicken on top with a few mixed herbs, slice and place on the meat a pound of tomatoes, pour over all half a pint of milk, season with pepper, salt, and an onion, chopped finely, place the pan and contents, with the lid on, in a moderate oven for two hours. Take out, put the chicken and ham on a dish, and keep hot; pass the tomatoes, etc., through a sieve, put in a saucepan, and boil up, thicken with flour and milk, and stir in a piece of butter the size of a walnut, pour over the chicken, and serve.

Chicken Pie.—Put a few slices of lean ham or bacon at the bottom of a pie-dish, and on this lay the chicken cut into neat joints; season with pepper, salt, chopped mushrooms, parsley, and a little shallot finely minced. Cover with another layer of ham, fill the dish with white stock, and put in the hard-boiled yolks of six eggs. Cover with puff paste, and bake for three-quarters of an hour.

Chicken, Roast.—Truss and roast the chicken (or fowl) for three-quarters of an hour or more, according to size, having first covered the breast with buttered paper. Ten minutes before serving up dredge with fine flour and baste well. Send to table with good brown gravy. Bread, oyster, egg, or mushroom sauce go equally well with roast fowl.

Chicken Sauté.—Put cut-up joints of chicken into a saucepan with an ounce of butter, lay the lid on, and let it fry, tossing the saucepan frequently to prevent burning. When brown add two onions that have been sliced and fried, four tablespoonfuls of tomato sauce, half a pint of brown gravy, some small button mushrooms cut in halves, chopped parsley, mixed herbs, and seasoning. Keep the lid on the saucepan, and let the whole gently simmer for about an hour. Serve hot.

Duck, Roast.—Stuff with sage and onion seasoning, and baste well before a brisk fire, dredge with flour a little before the roasting is done, to make them plump; send to the table the moment the steam draws towards the fire, with brown gravy round the dish, but not over the birds. Green peas are appropriately served with roast duck. If a pair are roasted together, the stuffing may be omitted from one of the birds as some people dislike it.

Goose, Roast.—Put into the bird stuff and secure sage and onions, and baste before a brisk fire for about an hour and a half, according to size. Serve before the breast falls, with a tureen of gravy made from the giblets, very little being placed in the dish. Nice apple sauce should be sent to table with goose. Geese are a good cold eaten at Christmas, but the birds are best at Michaelmas.

Turkey, Boiled.—Put one pint of milk in a stewpan with the same of water, boil up, then place in a small turkey with two blades of mace, one onion peeled, and cloves; put the lid securely on and gently boil, allowing half an hour to each pound of turkey if the bird be young, and longer if at all old. Lift the bird out, thicken the liquor with roux, strain and pour over the turkey.

Turkey, Boned.—Cut down to the backbone, and with a sharp thin knife work all the flesh and skin carefully away from the bones, and remove the latter. Next, bone legs and wings in the same way, taking away as many sinews as possible. Have ready about two or three pounds of sausage meat, according to the size of the turkey; season it and spread over the inside of the bird. Take some slices of lean ham or tongue, and lay them lengthwise, and a little veal stuffing. Roll up the bird with sausage-meat, etc., folded well inside; tie up tightly in a pudding-cloth.

Simmer gently for about two hours according to size. Untie and press; trim the ends, and brush over with glaze.

Turkey, Roast.—Fasten buttered paper over the breast of the bird, previously prepared for cooking, place it before a good roasting fire, some distance away at first, gradually drawing nearer, basting carefully all through the cooking, which should occupy two hours for a ten-pound turkey, and less for one smaller. Dredge lightly with flour a quarter of an hour before the roasting is complete, basting with fresh butter at the finish. May be stuffed with sausage or chestnut forcemeat, and served garnished with forcemeat balls. Good browned pork or beef sausages may be laid round the dish, and brown gravy and bread sauce sent to table with it in tureens. The stuffing of the bird should be carefully done, and the forcemeat well fastened in to secure fine flavour and a good appearance on serving.

PRESERVES.

(See also **Jam and Marmalade.**)

Preserved Cranberries.—Dissolve three-quarters of a pound of sugar in half a pint of water. Add, on bringing to the boil, a pound of cranberries, which should not be over two inches deep in the preserving pan. Boil until the skins break. Remove them with a straining spoon to a deep dish. The syrup should boil a few minutes longer, and then be poured over the berries.

Preserved Damsons.—Put the damsons into clean, dry, wide-necked bottles, sprinkle a little white granulated sugar in each bottle, and stand them in a saucepan, with clean cooking cloths between to keep them from jolting against each other. Pour in each bottle cold water to come half-way up, boil for twenty minutes, leave them in the water until quite cold, then tie air-tight cover over the top of each.

PUDDINGS, SAVOURY.

Pudding, Oyster.—Stew a score of oysters very gradually, strain and halve them, and put into a bowl where are already mixed breadcrumbs, salt, pepper, and a little cayenne. Add a little cream and two eggs. Steam in a basin for an hour, serve with white sauce.

Pudding, Savoury.—Half a pound of rice, quarter of a pound of brown breadcrumbs, two ounces of butter, two tablespoonfuls of minced parsley, one teaspoonful of dried herbs, grated nutmeg, pepper and salt, half a pint of melted butter and capers. Boil the rice until tender, drain and dry it, then mix with the melted butter, parsley, herbs, seasoning, and breadcrumbs, before it has become quite cold. Form into rolls about twice the thickness of an ordinary sausage, tie them in floured cloths, and place in boiling water. After boiling half an hour, take out of the cloths on to a hot dish, pouring over all a sauce made of one ounce of butter, half an ounce of flour, and half a pint of milk boiled together. Capers may be added to taste.

Pudding, Steak and Kidney.—Line a basin with suet and flour crust. Cut up the steak and the kidney, and place a layer at the bottom of the basin, and season this, continuing these layers of steak and kidney, until seasoning until the basin is full. Pour in a little water, and then cover the top with crust, pressing the crusts together to prevent the gravy escaping. Tie in a cloth and boil for two hours to four hours, according to the size of the pudding. Pour in boiling water when too much boils away.

PUDDINGS, SWEET.

Almond Pudding.—Six eggs, eight ounces of caster sugar, eight ounces of ground almonds (one better and the rest sweet), and a few drops of orange-flower water. Beat whites and yolks separately, then whisk them together, and stir in gradually the sugar and ground almonds. Beat for twenty minutes, then pour the mixture into shallow greased pie-dishes, and bake in moderate oven.

Apple Pudding.—Put two pounds of cut apples into a stewpan with cloves, the thin rind of half a

lemon and quarter pound of loaf sugar. Add a little water and pulp over gentle heat. Line a pie-dish with thin slices of stale sponge cake, and a thick layer of the apple mixture, first removing cloves and peel, and continue these layers until the dish is full. Put a teaspoonful of arrowroot into a basin. Mix it to a thin paste with milk. Put the remainder of a pint to boil, and pour it upon the arrowroot. Return the mixture to the saucepan, with lemon peel and six lumps of loaf sugar. Stir continually until it has boiled for three minutes. Then strain the mixture upon the yolks of two well-beaten eggs, and pour the custard upon the pudding. Leave until cold. Beat the whites of the eggs with sifted white sugar, pile it upon the pudding and bake brown.

Apple Pudding, Baked.—Put a layer of bread-crumbs in a buttered pie-dish. Then some sliced apples with two or three cloves, and most sugar. Then place more layers of each kind, leaving bread-crumbs for the top layer. Add a few lumps of butter, and bake in a moderate oven for about an hour and a quarter.

Bath Pudding.—Put six ounces of bread-crumbs in a basin with three ounces of butter, and one ounce of chopped suet; boil a pint of milk, and pour it on the bread, butter, and suet, mix well and let it stand till cold, then add two well-beaten eggs, sugar, nutmeg, and a wineglassful of brandy. Place in a buttered pie-dish and bake for twenty minutes; to boil, put in a basin, tie down, and keep steadily cooking for two hours.

Bread Pudding.—Put in a pudding basin alternate layers of jam and bread, pour over the whole a custard, flavour and sweeten, tie it down carefully, and boil for about half an hour.

Bread and Butter Pudding.—Butter a pie-dish and fill it with milk. Cut three slices about a quarter of an inch thick from a stale loaf, discard the crust, butter it on both sides, and put it in the cold milk in the pie-dish. Soak for three-quarters of an hour, then beat two eggs in a basin with a tablespoonful of sugar, a little grated nutmeg or cinnamon. Stir the eggs well into the milk, sprinkle a few sultanas or currants over the bread. Bake in a quick oven for half an hour.

Cardinal Pudding.—Place a chocolate cake in a glass dish, and with a two-inch cutter take a circle out of the middle. Pour a wineglassful of brandy over the cake. Grate six ounces of chocolate, and put it in a stewpan with a pint of boiled cream, six ounces of sugar, and the yolks of eight eggs. Stir the cream over the fire until thick, add two ounces of dissolved gelatine, stir, pour over the cake, and place to set. Ornament the top and sides with candied fruit.

Cocoanut Pudding.—Mix a quarter of a pound of desiccated cocoanut with twelve ounces of bread-crumbs and two ounces of butter; add three ounces of sugar and grated lemon rind, stir in a large cupful of milk, and steam in a bowl from two to three hours. An egg can be added if desired.

College Pudding.—Butter six cups. Boil up about the third of a pint of milk and pour it over half a pound of fine crumbs; add an ounce of butter, three ounces of currants, one ounce of candied peel, two ounces of brown sugar, a little grated nutmeg, and three well-beaten eggs. Put into cups, and bake in a moderate oven.

Cornflour Pudding.—Two tablespoonfuls of cornflour, one and a half pints of milk, one tablespoonful of caster sugar, one egg. Mix the cornflour into a smooth paste with a little cold milk; boil the rest of the milk, and pour it boiling on the paste; stir in the sugar and egg, and pour into a pie-dish, bake for a little over a quarter of an hour.

Currant Dumplings.—Put half a pound of flour on the pasteboard with three ounces of dripping. Chop the dripping well with the flour, put it in a dry basin, and mix in a tea-cupful of cleaned currants, two tablespoonfuls of sugar, and a little grated cinnamon. Pour enough cold water into the mixture to make it into a compact mass. Tie the pudding, made up into a round ball with well-floured hands, tightly into a cloth, put at once into a saucepan half full of boiling water, and boil steadily for ninety minutes.

Custard Pudding, Baked.—Break three eggs

into a basin, beat them well, add a heaped teaspoonful of sugar, the grated rind of a lemon, and stir in a breakfastcupful and a half of milk. Butter the pudding-basin, pour in the mixture, tie a pudding-cloth on and boil three-quarters of an hour.

Fig Pudding.—Mix together half a pound of bread-crumbs, a quarter of a pound of chopped suet, same quantity of brown sugar, half a pound of chopped figs, two eggs and a cupful of milk. Steam in a buttered basin for three hours.

Gooseberry and Rice Pudding.—Put a shallow layer of green gooseberries into a buttered pie-dish. Scatter sugar and a little grated lemon peel over it, then a thick layer of boiled rice, and then further layers. Sift bread-crumbs over the top, with a little butter on them and bake in a moderate oven, until the fruit is done.

Gooseberry Pudding, Baked.—Place a quart of gooseberries in a saucepan with half a pound of moist sugar. Boil until the berries form a soft pulp. Then beat into them three eggs, one tablespoonful of butter, one breakfastcupful of bread-crumbs. Put into a buttered pie-dish, and bake for thirty minutes.

Marmalade Pudding.—Half a pound of flour, quarter pound of suet, two eggs well beaten, three tablespoonfuls of marmalade, and a little sugar. Mix well, and boil three hours in a buttered basin.

Marmalade Pudding, Baked.—Line the sides of a pie dish with paste, and cover the bottom of the dish with marmalade. Beat up two eggs with half a pint of milk, add a cupful of bread-crumbs, and grated lemon peel. Pour this over the marmalade, and bake for three-quarters of an hour. Serve hot.

Norfolk Dumplings.—Take one pound of flour, two or three teaspoons of baking powder, a quarter of a pound of butter or dripping, and plenty of currants. Rub the butter into the flour, mix with a little water until dough, then work with the hands into dumplings, and boil twenty minutes.

Plain Plum Pudding.—Pour half a pint of milk over one pound of fine bread-crumbs, and let them lie half an hour; then beat in a quarter of a pound of brown sugar, quarter of a pound of suet, half a pound of raisins, stoned and chopped, half a teaspoonful of grated lemon peel, beat it up well with three eggs, put in a buttered basin, and boil over four hours.

Plum Pudding.—Mix together a pound each of stoned raisins, currants, sultanas, mixed peel, bread-crumbs, and chopped suet. Add a quarter of a pound of flour, a dessertspoonful of mixed spice, two ounces of chopped almonds, four eggs, and sufficient milk to moisten. Stir all well together, and put into buttered basins. Tie down with pudding-cloth, and boil for six to eight hours.

Sago Pudding.—Wash a tea-cupful and a half of small sago; put it in a dish with a pint and a half of milk, a tablespoonful of sugar and a pinch of salt. Let it stand for half an hour, then place in a moderate oven for an hour and a half without moving or stirring it.

Rabbit Brawn.—Take the meat from a cold boiled rabbit and half a pound of cooked bacon. Cut it into tiny squares. Butter a brawn glass or tin, put in the meat with two chopped hard-boiled eggs, with seasoning of salt and pepper. Take sufficient stock to fill the mould, dissolve in it enough gelatine, according to the size of the mould, to make the stock a thick jelly when cold. Pour the stock over the rabbit, and put in a cold place until set.

Rabbit, Curried.—Slice two or three onions and fry brown in butter, then fry the joints of the rabbit, take them out and add a good curry sauce to half a pint of stock, and stew the rabbit till tender. Serve with boiled rice.

Rice, Fried Egg and.—Parboil some nicely washed rice, simmer till cooked in good stock or gravy, with half a teaspoonful of curry powder, cayenne, salt, and a squeeze of lemon juice. Set on a hot dish with fried eggs on the top.

Rice Pudding.—See also **Puddings, Sweet.**—Put a tea-cupful of Java rice with a quart of milk into a pie-dish with four lumps of sugar. Bake in a very slow oven for an hour.

Rice Pudding with Currants.—Wash half a

pond of rice, tie in a cloth, allowing room for swelling, and put into a saucpan of cold water, let it boil one hour, then take up, untie, stir in half a pound of currants and tie up again rather tight, and boil for another hour.

Rice, Savoury.—Parboil rice, drain, put into a sauté-pan with a tablespoonful of salad oil, and fry a light brown. Add a large tablespoonful of tomato sauce, season with salt and grated cheese. Cut savoury sausages into slices, fry a little of the rice on each slice, and serve with thin dry biscuits.

Rissoles, Beef.—To each pound of cold roast beef, allow three-quarters of a pound of breadcrumbs, salt and pepper to taste, a few chopped herbs, half a teaspoon of minced lemon peel, one or two eggs, according to the quantity of meat. Mince the beef, and mix the breadcrumbs, herbs, seasoning, and lemon peel. Make all into a thick paste with one or two eggs, divide into balls, and fry a nice brown.

Rissoles, Fish.—To any quantity of cold cooked fish, after removing the skin and bones, add a third part of grated breadcrumbs and finely minced onion, some cold melted butter, and the yolks of two eggs; season with pepper and salt. Make puff paste, roll it thin, and cut into squares of two inches. Place about a teaspoonful of the mince on each square, and fold over with paste. Wet the edges of the paste before closing them, that they may adhere, and fry in boiling fat, first covering the rissoles with egg and crumbs. Serve dry.

Rissoles, Kidney.—Cut three-quarters of a pound of ox kidney into slices, and fry gently in butter; when cool, mince finely, also mince half a pound of cooked ham, mix with the kidney, adding two tablespoonfuls of breadcrumbs, one of chopped parsley, one of chopped mushrooms, and a finely chopped shallot, pepper and salt. Mix with a little brown sauce, and spread on plate to cool. Shape into balls, brush over with egg, roll in fine breadcrumbs, and fry brown.

Roux, White.—Roux is the foundation of many sauces, and can be kept for a few days, especially in winter. Melt four or five ounces of butter in a pan, and then add in by degrees as it melts an equal quantity of flour, allow these to cook together for twelve to fifteen minutes without colouring, then place in a clean jar, and cover with a sheet of white paper twisted over.

Roux, Brown.—This is made exactly like white roux, save that it is allowed to colour gently till it is a fawn colour, it must be cooked very slowly for at least thirty minutes, sprinkle salt, and keep it in a jar.

SALADS.

Salad, Banana.—Slice some ripe bananas into a glass dish, then put a layer of oranges cut in the same way, then another layer of bananas, and oranges again. Sprinkle with sugar, and over all squeeze the juice of a lemon. This is much liked by children.

Salad, Chicken.—Trim some cold chicken into joints. Wash and dry a lettuce, slice and put it in a glass dish, with the pieces of chicken on the top, slice some cucumber and a beetroot round it, pour over all some salad dressing, dredge chopped egg and green onion on top, and serve.

Salad, Corned Beef.—Cut corned beef into nice pieces, and grate horseradish, and a small shallot finely chopped, over it. Cover with dressing, and garnish with watercress.

Salad, Dressing.—Yolks of two eggs, one tablespoonful of butter, one teaspoonful of mustard, a little sugar, salt, cayenne, half a teaspoonful of vinegar. Mix the butter in a saucpan, mix in a teaspoon of the mustard, vinegar, salt, and cayenne, beat up the yolks of the eggs, add mixture, stirring all the time, add butter, stir until it thickens like custard, leave to cool, and thin down with milk.

Salad, Fish.—Mix two cupfuls of cold flaked boiled fish with one of chopped white celery, well seasoned, and turn over all two tablespoonfuls of oil, one of vinegar, and one of lemon juice. In an earthen pan put a quart of peeled and sliced tomatoes, ten drops of onion juice, salt, cloves, and a blade of mace. Cook until the tomatoes are soft enough to press through

a sieve. Add one-third of a box of gelatine that has been soaked in one-third of a cup of cold water until dissolved. Add one and a half tablespoonfuls of vinegar, mixing thoroughly.

Salad, Potato.—Take ten or twelve cold boiled potatoes, four tablespoonfuls of vinegar, six of salad oil, pepper, salt to taste, and a little minced parsley. Cut the potatoes up into half-inch thickness, put into salad bowl with oil and vinegar, season with pepper and salt, mix in parsley, and mix thoroughly.

Salad, Winter.—The white, tender part of celery may be chopped and served with French dressing, or with mayonnaise, in winter salads. Hard, white cabbage, if shaved into thin strips and soaked in cold water, also makes a good salad, or celery and cabbage.

Sandwiches, Afternoon Tea.—Finely minced crisp radishes form the basis of these sandwiches. They should be washed and peeled, and be as young as possible. Wafer-thin slices of brown bread must be spread with whipped cream and some grated Parmesan, and the radishes added in a thick layer between them.

Sandwiches, Cheese.—Cut some thin slices of stale bread, stamp out into circles, and fry in boiling fat. Put on each circle a little grated Parmesan, mix with a little mustard and pepper. Set in a brisk oven till the cheese dissolves, and serve hot.

Sandwiches, Chocolate.—Grate some best chocolate finely, and make it into a stiff paste with whipped cream, add a few drops of vanilla. Spread on thin bread-and-butter, and cut into fancy shapes.

Sandwiches, Hard-boiled Egg.—Hard-boiled egg sandwiches are much improved by the addition of a little watercress, lettuce, or endive. Beetroot, watercress, celery, tomatoes, and mustard and cress make good sandwiches with egg.

SAUCES.

Sauce, Bordelaise.—Bordelaise Sauce has Sauce Espagnole for a basis. To a gill of the latter is added two gills of Sauterne, a tablespoonful of chopped parsley, a tablespoonful of chopped shallot, and mignonette pepper. This sauce should be carefully skimmed.

Sauce, Celery.—Rub the celery, when boiled tender, through a sieve. Melt a lump of butter in a saucpan, and stir into it a tablespoonful of flour. Add gradually some of the water in which the celery was boiled, and a tablespoonful of cream, and serve hot.

Sauce, Cranberry.—Boil a quart of cranberries, without stirring, for ten minutes. Add one pound of sugar, and boil till clear, which will be another twenty minutes.

Sauce, Egg.—To make egg sauce, grate two or three hard-boiled eggs, and add to these a little over half a pint of melted butter.

Sauce for Stewed Fruit.—Simmer half an ounce of very fine sago in a pint of milk, till the grain almost disappears. Sweeten and flavour.

Sauce, Hollandaise.—Put the yolks of four eggs in a small saucpan, mix them with an eighth of a teaspoonful of salt, the same of grated nutmeg; set the saucpan in a vessel of hot water on the table; add by degrees four ounces of butter in small pieces, stirring constantly. Then place the saucpan for a few minutes over the fire and stir till the sauce is smooth and thick. Add half a tablespoonful of lemon juice and half a gill of whipped cream.

Sauce, Horseradish.—Mix together two tablespoonfuls of grated horseradish, a teaspoonful each of made mustard, sifted sugar, and salt, a tablespoonful of vinegar, or rather more if preferred sharp, and three tablespoonfuls of cream. Serve cold in a boat sauce.

Mixed Butter.—Melt two ounces of butter in a clean pan, then sprinkle in from one to two ounces of flour, according to the richness desired, and stir this over the fire till the butter is quite melted, and the flour has been absorbed, so that a smooth paste is formed which can be lifted clean from the pan, then add gradually half pint of water, stirring this steadily the whole time; when the water is all added let it boil for ten to twelve minutes, stirring it occasionally to ensure the flour being perfectly cooked, and use. For special

occasions half ounce more butter may be added with a squeeze of lemon juice, just as the sauce is being poured into the tureen.

Sauce, Mustard.—To one cupful each of grated horse-radish and dry mustard, add a bunch of sweet herb chopped fine, or a large onion grated, a table-spoonful of salt, and enough cold vinegar to reduce the sauce to the consistency of ketchup.

Sauce, Tomato.—Six pounds of tomatoes, one and a half pints of vinegar, one large teaspoonful of salt, one and a half ounces of ginger, four cloves of garlic, one teaspoonful of pepper-corns, two blades of mace, a good dust of cayenne. Put the tomatoes into a saucepan with half a pint of water, and cook them until they are soft, then rub them through a hair sieve. Next put them back into the pan with all the other ingredients. The ginger (after bruising it), pepper-corns and mace should be tied together in a piece of muslin. Let all boil with the lid off the pan till the sauce is as thick as good cream.

White Sauce.—This is made exactly like melted butter, save that milk is substituted for the water.

Sausages, Beef.—To two pounds of steak from the shoulder add four ounces of suet, half a pound of breadcrumbs, salt, pepper, and allspice.

Sausages, Mutton.—To one pound of mutton fillet add six ounces of beef suet, a quarter of a pound of breadcrumbs, one shallot finely minced, a teaspoonful of salt, and a sprinkling of pepper, nutmeg, and mace. Also two eggs well beaten.

Sausages, Oxford.—Add one and a half pounds of pork, same quantity of veal, three-quarters of a pound of beef suet, half a pound of bread steeped in water, and season with about thirty sage leaves finely chopped with pepper, salt, and nutmeg.

Sausages, Pork.—Add two pounds of fresh pork to half a pound of bread, a teaspoonful of salt, a quarter of a teaspoonful of powdered nutmeg, and twenty finely-chopped sage leaves. Sprinkle with pepper. When the meat is minced, add it to the bread scalded and squeezed dry, or form a paste by the addition of two well-beaten eggs.

Sausages, To Cook.—To fry sausages, some little skill is required, or the skin will burst. All sausages should have the skin pricked in several places with a fork to allow for the expansion of the contents when heated, but the chief point is to apply the heat slowly. Sausages are sometimes first rolled in flour or fine oatmeal, so that they are thickly coated before they are fried. Fried sausages may be served on a mound of stewed red cabbage, stewed savoy, mashed potatoes, or fried onions.

SAVOURIES.

Beef Toast.—Mince cold roast beef finely, add pepper and salt, and put into a stewpan with a little good gravy. Thicken it with a small piece of butter rolled in flour. Fry the bread, and spread the mince nicely and evenly over it.

Egg Toast.—Toast a piece of bread on one side only, and butter it while hot on the side that is not toasted. Over this spread a well-beaten egg, flavoured delicately with pepper and salt. Heat this gently before the fire.

Fish, Savoury.—Free the remains of cold boiled fish from skin and bones, and stir the flakes into oyster sauce, or melted butter. Season with pepper and salt, add a squeeze of lemon, and make quite hot. On a hot dish pile up some mashed potato, and leave a space in the centre. Fill up with the fish mixture, sprinkle over finely-chopped parsley, and serve hot.

Mock Oysters.—Boil a calf's sweetbread in salted water. Wash some oyster shells in water, and on each lay a little finely-minced herring. Cut the sweetbread into small pieces, and dip them in seasoned bread-crumbs. Lay each piece in a shell. Sprinkle crumbs and a little herring over them. Put a little butter on each, and brown before the fire.

Savoury Toast.—These can be made of the remains of any cold roast game or fish, which should be carefully freed from the bones, and pounded with a little butter to a stiff paste. The skin and bones should be made into a good gravy, which mixed with the

pounded meat makes a thick purée. Make this very hot, and spread it on rounds of fried toast. Sprinkle with pepper and chopped parsley, and serve.

Sheep's Head and Trotters.—Take out the brains and rub the head and feet with them, and leave them overnight. Next morning put the head into a saucepan with cold water to cover it. Let it come to a boil, draw away from the fire and leave it for about half an hour. Next scrape it and wash it again. Put it on in cold water, boil, skim well and cook gently for two hours. Scrape two carrots, peel a turnip, cut them in quarters, add them and boil gently for another hour. Put the head and trotters in a large dish with the vegetables round and a little of the liquor, and serve.

Scotch Scones.—Rub one pound of flour into two ounces of good butter till smooth, and then mix into it two ounces of caster sugar, and half an ounce of cream of tartar; dissolve a quarter of an ounce of baking powder in half a pint of milk, and mix it into a light dough, roll it out about an inch thick on a floured board, and cut it up into shapes, put them on a floured tin and bake in a moderate oven for a quarter of an hour.

Scotch Scones (Girdle).—Mix half a pound of well-sifted flour with half a teaspoonful each of carbonate of soda, cream of tartar, a pinch of salt, and a teaspoonful of sugar. Stir all together and rub in an ounce of butter, make a soft dough with buttermilk, roll out the dough, cut into small rounds with a sharp cutter, heat the girdle, sprinkle with flour, and place the scones on, taking care they do not touch. When well risen, and done on one side, turn once, and finish baking.

Scotch Shortbread.—Lay a half pound of flour a quarter pound of granulated sugar, and a quarter pound of salt butter separately on a baking paper. Pour a dessert-spoonful of water over the sugar and work the butter into that. Then add the flour and work into a firm dough. Cut into halves. Make two square cakes about half an inch thick. Press the edges with finger and thumb, and the centre with a fork, and bake on a fat tin till a delicate brown shade.

Soufflé, Veal.—Put a table-spoonful of butter in a saucepan, and when melted stir in a table-spoonful of flour. Season with cayenne pepper, nutmeg, anchovy sauce, and salt. Pour in half a pint of boiling milk, in which an onion has been cooked. Stir till smooth; add to it half a pint of chopped cooked veal, and heat all together. Draw the pan aside, and add the beaten yolks of two eggs. When the mixture is cooled sufficiently add the beaten whites of the eggs. Set in a greased baking dish, place mushrooms on it, and bake in a hot oven for twenty minutes.

SOUPS.

Soup, A very Cheap.—Take six large mealy potatoes, two leeks, three ounces of crushed tapioca, one ounce of butter or dripping, a quarter of an ounce of sugar, one pint of milk, and one quart of boiling water. Slice the potatoes and leeks into boiling water, boil to a pulp, then rub through a sieve and put back into the stock. Shake in gently the tapioca. Boil ten minutes, add milk and dripping, boil up and serve.

Soup, Clear.—A clear soup looks better when a few green peas or a few pieces of celery are added, as they increase the brilliancy of the soup, and a thick soup is greatly improved by the addition of a few small croutons, and so on. The toast looks more inviting when cut into strips or triangles, or with the corners neatly cut off if served in whole slices.

Soup, Green Pea.—Soak one pound of dried green peas in cold water for twenty-four hours. Place them in a saucepan with two quarts of cold water, one large or two small onions, one head of celery and an ounce of dripping. Boil all together until the peas are quite tender. Pass the soup through a wire sieve. Return it to the saucepan, add a gill of milk, pepper and salt to taste. Boil and serve.

Soup, Hare.—Pick from the remains of a jugged hare the nicest pieces of meat, and cut into dice to

add to the soup later. Put the bones left into a stewpan, with one large onion stuck with cloves, one carrot cut into slices, and two or three leaves of celery cut into inch lengths, and also a slice of stale white bread without crust. Pour over about three pints of stock and allow to simmer gently until the vegetables are quite tender. Strain, and rub as much of the vegetables through the sieve as possible, then return the soup to the stewpan and boil up. Thicken with browned flour, adding a wineglassful of port wine, a tablespoonful of red currant jelly, and a squeeze of lemon-juice.

Soup, Haricot.—Put a pint of small haricot beans to soak in cold water overnight, drain them and put them in a saucepan with a large Spanish onion roughly chopped, two ounces of fresh butter, salt and pepper, and two quarts of cold water, and boil gently until the beans are quite soft, after which pass the whole through a fine wire sieve, rubbing the pulp through patiently with the back of a wooden spoon, and moistening it frequently with a little of the liquid; then return the purée to the saucepan, add about a pint and a half of hot milk, and a large, tablespoonful of chopped parsley, bring to the boil again, and serve.

Soup, Lentil.—Boil up three pints of white stock, add a quarter of a pound of lentils, a head of celery, three onions, carrot and turnip, cut up, a little mace, thyme, parsley, and two bay leaves. Boil and strain. Add a half pint of milk, with an ounce of flour. Stir in the yolks of two eggs, a piece of butter, and serve hot.

Soup, Mock Turtle.—Mock turtle soup should be flavoured with a bouquet of sweet herbs, onions, carrots, peppercorns, and salt.

Soup, Mulligatawny.—Chop and fry in butter a quarter of a pound of lean ham, three ounces each of carrot, onion, and apple. Add three tablespoonfuls of curry powder and the same quantity of flour, and fry a little longer. Then put them in a stewpan with two quarts of bone stock, and simmer all together for an hour and a half. Strain, return to the stewpan, and make thoroughly hot again, adding lemon-juice and salt. Cut some meat from a cooked fowl, or pieces of cooked white fish will do as well, lay these in a tureen and pour the hot soup over.

Soup, Mushroom.—Cut one and a half pounds of mushrooms into square-shaped pieces, put them into a saucepan with a pint of good stock, and boil for a few minutes, or until tender. Add a seasoning of salt and pepper, pour in a pint of milk, stir in a piece of butter the size of a walnut, thicken with arrowroot, and serve as hot as possible.

Soup, Ox-tail.—Put into a stewpan with an onion, a carrot, and a savoury herb, an ox-tail cut into joints, add to it a quart of water and simmer very gently for four or five hours. Then strain off the liquor, skum, and season, keeping it hot. Mix a tablespoonful of flour with a little cold water in the stewpan, pour the strained liquor to this, add meat and vegetables, let it all boil up once, then pour into tureen.

Soup, Oyster.—Take a quart of oysters, two ounces of butter, one quart of milk, half a pint of water, pepper, salt. When near boiling, pour in the milk, stirring all the time. Season and let the soup get just to boiling point. Put in the oysters and let them stew five minutes. Then put in the butter and stir melted.

Soup, Pea.—Stew a quart of split peas, soaked overnight, in four quarts of good beef broth, for an hour. Pass through a sieve, season to taste, and heat again. A little celery and other suitable vegetables will flavour and improve the soup, and bacon or veal may be cooked with it. Powdered dry mint should be sprinkled in before serving.

Soup, Tomato.—Two pounds of tomatoes, two ounces of bacon, one ounce of dripping, one ounce of sage, one carrot, one onion, one stick of celery, one quart of stock, a bunch of parsley and herbs, salt and pepper. Cut the bacon into small bits, and fry it in the dripping for a few minutes. Wash and prepare the vegetables and cut them up into small dice; fry them in the dripping for about ten minutes; next slice and add the tomatoes, add also the stock and herbs. Put the lid on the pan, and cook the contents till they are tender, then rub them all through a sieve; put the

soup back into the pan, bring it to the boil, then sprinkle in the sage. Let the soup boil till the sage is quite clear. Season the soup nicely with salt, pepper, and a dust of caster sugar.

Soup, Vegetable.—Peel, wash and cut up six potatoes, three turnips, two carrots, two onions, and one small head of celery. Stew all gently for two and a half hours; strain, add pepper and salt, and a little sauce or ketchup if preferred.

STEWES.

Stew, Beef Kidney.—Slice one pound of kidney, season and flour. When these are fried sufficiently, take out, and make a gravy in the pan with butter, flour, pepper, salt, mixed herbs, and water. A little mushroom ketchup is a nice addition.

Stew, Hot-Pot.—Cut one pound of buttock steak into pieces about three inches long and wide; sprinkle these well with pepper and salt. Butter a pudding basin and put in a layer of raw potato peeled and cut in slices, one onion sliced, a tablespoonful of finely-chopped parsley, then a layer of seasoned steak, then potato, onion, parsley, and steak until the basin is full. Pour over a breakfastful of boiling water, cover the top with an extra thick layer of sliced potato, put a plate that will stand the heat of the oven on top, and bake in a hot oven for an hour and a half.

Stew, Irish.—Two pounds of sirloin end of neck of mutton, ten potatoes, four small onions, and nearly a pint and a half of water, pepper and salt. Take the mutton and divide it into portions, put it into the stewpan with alternate layers of sliced potatoes and onions, add the water (cold) and season with salt and pepper. Cover the stewpan closely, and let it stew gently until the greater part of the gravy is absorbed.

Stew, Rabbit.—Cut a young rabbit that has been soaked for half an hour into joints, and stew for an hour in milk, with a little butter, three or four chopped onions, and a blade of mace. Thicken with flour and season.

Stew, Scotch Hotch-Potch.—Prepare one quart of mixed vegetables in equal quantities, carrots, turnips, celery, onions, sprigs of cauliflower, and a gill of dried peas, and add three quarts of water in which mutton has been boiled. When boiled tender, add a few mutton chops freed from fat, pepper, salt to taste, and a lump of sugar. The peas will require to be soaked over night.

Stewed Steak.—A pound and a half of beef-steak, two onions, stuck with cloves, a glass of wine, pepper and salt. Cut the steak into slices, roll them and arrange them in a stone jar. Add onions and cloves, a glass of wine, with pepper and salt. Cover tightly, place in pan or boiling water, and cook gently.

Stuffing for Poultry and Pork.—Peel and cut six onions into quarters, boil until half-cooked. Drain and chop finely, adding a piece of butter and an equal quantity of bread-crumbs, one good sized teaspoonful of powdered sage, a small quantity of chopped parsley, salt and pepper to taste, and a little sugar. Mix thoroughly.

Stuffing (Mushroom) for Vegetables.—Add a small cupful of chopped mushrooms to a similar quantity of fine bread-crumbs, one tablespoonful of finely chopped parsley, a dust of powdered thyme, a pinch of lemon-rind, and the smallest portion of onion. Mix all thoroughly, then fry in boiling fat, and use as a stuffing for marrow, tomatoes, or large onions.

Sweetbreads, Dainty.—Fry about three Spanish onions in butter with some small squares of bacon. Add half a pint of stock and thicken with flour. Squeeze in a little lemon juice, and add two sweetbreads, previously soaked in salted water, blanched, skinned, and sliced. Let all this simmer for an hour, stirring occasionally. Serve hot on toast.

SWEETS.

Apple Snow.—Stew a few nice apples, peeled and cored, with a few cloves. Sweeten, and add a little lemon juice and grated rind. Beat the whites of

two eggs into a stiff froth, and lay on the top of the apple pulp. A little coloured jelly may be spread around the sides.

Chocolate Caramels.—Put one cup each of brown sugar, treacle, and milk, and one tablespoonful of glycerine into a kettle and boil fast. When nearly done add one cup of grated chocolate, and test by dropping a little into cold water. When done pour into buttered pans and cut into squares.

Chocolate Wafers.—One teacup of brown sugar, same quantity of granulated sugar, same of butter, one egg, one cup of grated chocolate, vanilla essence, and a cup and a half of flour. Mix all to a dough with the milk and egg beaten well; roll out very thin on a floured board, cut into rounds, and bake quickly.

Devonshire Junket.—Heat one pint of fresh milk to the temperature of new milk. Add one teaspoonful of essence of rennet, a wineglassful of brandy, a tablespoonful of castor sugar, and a teaspoonful of ground cinnamon. Leave in a cool place to set. Spread with clotted cream.

Gooseberry Charlotte.—Butter a plain mould well; then line it closely with sponge fingers cut in even lengths and fitted closely into the mould. Have ready some gooseberry pulp made as for gooseberry cream and half an ounce of gelatine dissolved in a little hot milk; pour all into the mould, keep in a cool place till set, then turn into a glass dish.

Gooseberry Fool.—Put a quart of green gooseberries into a saucepan with a little water and about half a pound of sugar; let it boil until the fruit is quite tender and a pulp, beat it through a coarse sieve. Then add gradually one pint of cream, put it on a piece of ice, and stir it every now and then until cool.

Lemon Cheese.— $\frac{1}{2}$ lb. of butter, $\frac{1}{2}$ lb. of loaf sugar, the rind and juice of three lemons. Put all in a stewpan, after grating the peel and straining juice. Keep stirring over heat until sugar dissolved, and it begins to thicken; when of the consistency of honey it is done.

Tripe, A Nice Way to Cook.—Wash two pounds of tripe carefully in cold water, and dry in a cloth. Put it into a stew-pan, cover with equal parts of milk and water, add two onions and a bunch of parsley, and simmer for an hour. Rub one ounce of butter smoothly with a little flour, moisten with a quarter of a pint of cream, and stir it into the sauce. Add the thin rind of half a lemon, a little pepper and salt, then simmer for another hour, and serve.

Veal Chops.—Cut some neck chops, saw away the chine bone and cut off all gristle and skin; trim them very neatly. Have ready a little fat bacon, parsley, shallot, and a few mushrooms, all finely minced. Well butter some sheets of white notepaper, allowing one for each chop, sprinkle the paper well with the bacon, etc., and fold it neatly round the chops; grill over a clear fire for about a quarter of an hour, turning them once or twice.

Veal Cutlets.—Cut about a pound of veal into neat, oval-fattened pieces, dip each in flour, and brush over with some beaten egg and roll in breadcrumbs, which have been seasoned. Fry these in very hot dripping till nicely browned. Stir four ounces of cooked spaghetti into some white sauce, and sprinkle over one and a half ounces of grated cheese.

Veal Fillet of.—Remove the bone and fill the space with forcemeat, skewer and tie with string. When it begins to roast throw a little salt over it, baste it, and dredge with flour. For stuffing, chop half a pound of suet, put in a basin with one pound of breadcrumbs, a teaspoonful of salt, a little pepper, thyme, parsley, and three eggs, and mix well.

VEGETABLE COOKERY.

Beans Haricot.—These must be allowed to boil gently till they are tender, and this will take about two hours; pour off the water and stand the saucepan by the fire, shaking it every now and then to help drying. A small piece of butter, and a sprinkling of pepper and salt should be put with the beans before serving.

Brussels Sprouts.—Trim and throw the sprouts into cold water; let them remain in for half an hour, take them out, thoroughly rinse and put them again into tepid water. In a few minutes drain and throw them into boiling water, slightly salted. Boil without the lid of the saucepan until the sprouts are tender, strain them through a colander, put them into a stewpan with a little butter and a pinch of pepper and salt, shake over the fire for four or five minutes, and serve.

Cabbage, An Idea for Cooking.—Put about the size of an egg of breadcrumbs tied in a fine cloth in with the cabbages when cooking. Cabbages cooked like this can be used in any possible way; the bread having absorbed all bitter juices they cannot harm, while they are digested quite easily. Another advantage of this style of cooking is that the breadcrumbs absorb almost all the smell which usually accompanies the cooking of cabbages.

Cabbages, Boiled.—Nothing is so unsatisfactory as a badly boiled cabbage, much more so than one well done. Get a nice tender green cabbage of a good size and about all fresh; quarter it, and wash it well; lay it in cold water till required. Put on a nice large pot with plenty of water, and some salt. When it boils add your cabbage, getting it all under water; boil from 20 to 30 minutes; strain, and press all the water from it. Dish neatly and score across with a knife; while hot, add about two ounces of butter and let it melt in, sprinkle with pepper and salt.

Cauliflower, Baked.—Cut off the leaves and stalk of one or two nicely boiled cauliflowers, and arrange a few of the pieces in a pie-dish. Blend an ounce of butter with half a pint of milk and water (in equal quantities), add one ounce of butter, and season with salt and pepper. Boil the sauce for a few minutes over the fire, then stir into it one ounce of grated cheese—Parmesan is the best. Pour the sauce over the layer of cauliflower, put on the remaining pieces of the vegetable, then pour on the rest of the sauce. Cover the top with grated breadcrumbs and a teaspoonful of grated cheese, place a tiny bit of butter here and there, and bake in a hot oven.

Cauliflower, Boiled.—Cut off the end of the stalk of the cauliflower and give it a good rinsing under the cold water-tap, but do not leave it in water, it makes it taste rank. Have ready a saucepan of boiling water, with plenty of salt in it; put in the cauliflower and boil gently until it can be easily pierced with a fork. Take out carefully with a spoon, on a hot dish; pour a nicely made parsley and butter sauce over.

Potatoes, Baked.—The most wholesome way of cooking a potato is to bake it. A small piece of the skin should be cut from the ends before baking.

Potatoes, Steamed.—Let the potatoes be well washed, but not pared, and put them into a steamer when the water boils in the saucepan beneath. They will take about three-quarters of an hour to cook, and should be taken up as soon as done, or they become watery.

Seakale, To Cook.—Seakale must be allowed to stand in salted water for at least an hour before cooking it. Well cleanse it, and tie it up neatly in small bundles. Plunge it into boiling water containing salt and the juice of a lemon. Boil quickly for twenty minutes.

Tomatoes, Baked.—Scald and peel a sufficient quantity of smooth, round tomatoes; put into a deep earthenware dish and sprinkle plentifully with salt and pepper; have a teacupful or more, according to the quantity of tomatoes, of fine cracker crumbs and spread over the top. Bake in a quick oven from thirty to forty minutes. Drop a few lumps of butter on to the tomatoes, and serve.

Tomatoes, Fried.—Cut round solid green tomatoes in rather thick slices without peeling, also some tart, firm apples. Have some pork dripping or olive oil hot in a good-sized frying pan, roll the slices in batter or flour seasoned with salt and pepper, and fry a golden brown on either side.

Vol-au-Vent. (See "Culinary Terms" in "Cookery Hints.")

PEARS'
DICTIONARY
of HEALTH.

EDITED BY
ANDREW WILSON, Ph.D., M.B., F.R.S.E., F.L.S.

Pears' . Dictionary of Health

INTRODUCTION.

By ANDREW WILSON, Ph.D., M.B., F.R.S.E., F.L.S.

(Lecturer on Physiology and Health to the George Combe Trust, &c.),

and ROBERT BELL, M.D., F.R.P.S.G.

This "Dictionary of Hygiene" should serve a useful purpose, in that it presents, in a handy and popular form, a large amount of information regarding the preservation of health and the prevention of disease. A certain amount of medical information has likewise been included, so as to familiarise the reader with the meaning of medical terms, and to assist him in the comprehension of the principles of treatment. Such knowledge is the more likely to induce people to send for a medical man at once in cases in which professional assistance is required. The various subjects have been revised and brought up to date as efficiently as possible. Specially useful should be found the many references to drugs and medicines, and to the treatment of accidents and emergencies. All literature of this kind should be commended, because its diffusion must aid in the better appreciation of the laws of health, and in the advance of that opinion which teaches that only by observance of these laws is happiness to be secured.

As health is the first necessity of humankind, without which life's pleasures and successes are unattainable, it is of extreme importance that people should know the main features and functions of their physical construction, and at the same time be informed regarding the causes of disease, and also possess such a practical acquaintance with every-day remedies as will serve to keep them in the way of health. Many a doctor's bill has been saved by a little knowledge of how to handle common ailments and prevent them from developing into more serious troubles. In the same way, it is advantageous to know something of the nature and treatment of diseases generally, so that in the preliminary stages of illness such measures may be taken as will be helpful to the surgeon or the physician, when he has to be called in. Thousands of lives are sacrificed every year for the lack of this little knowledge. The scientific study of medicine is of course beyond the attainment of all but those who devote themselves to it as a profession, but it is within the power of almost anyone to gain sufficient knowledge of the subject for ordinary purposes. This Dictionary of Health aims at supplying such information, and it is presented in alphabetical form as the easiest for reference. Incidentally, all medical terms usually employed in the denomination and treatment of ordinary ailments are briefly explained.

Abdominal Injuries may proceed from internal injuries, occasioning collapse and dangerous hæmorrhage. Put the patient to bed and apply ice, emptying the bladder, and administering brandy to combat immediate collapse, pending the arrival of medical assistance.

Aberration, or "mind wandering," is a term applied in cases of partial insanity. [child.]

Abiotation. Want of milk; the weaning of a child.

Abluent, that which cleanses.

Ablutio, the act of cleansing, as by washing.

Abnormal, that which deviates from the ordinary condition; irregular, malformed.

Abortion, premature expulsion of the fœtus, or unborn child, accidental or procured by interference.

Abrasion. Removal of skin, external or internal, by friction or violence, as by falling or being struck or grazed by a rough or hard substance or missile. Curative treatment consists in cleansing by antiseptics, the most effectual for the purpose being diluted carbolic acid (of the strength of 1 to 20).

Abscess. A collection of purulent matter in the tissues of the body, occasioning swelling, external or internal. Should pus or "matter" be formed,

swelling and severe pain will follow; but if the abscess be charged with non-purulent fluid only, inconvenience will be the extent of the trouble. In either case it is desirable that the fluid should be got rid of, and this may be accomplished by lancing and pressure, by fomentation, or by the application of hot poultices and antiseptic treatment. Abscesses are frequently the result of a blow or other violence, frequently also they follow weakening illness, the most common cause being infection by certain germs.

Abcission. Cutting out of the soft parts of the body, as the elimination of fleshy tissue, to prevent the extension of disease; distinguished from amputation, a term which comprehends division and removal of bone also.

Absorbents. Vessels which absorb, such as the lacteals and lymphatics (absorbents); a term also applied in pharmacy to antacids and other chemical bodies which take up fluid.

Astergent. Equivalent to detergent, something calculated to remove offensive matter from the body.

Acarus. A genus of mites, including those which burrow between the cuticle and true skin, occasioning that troublesome malady known as the itch. The

treatment aims at the destruction of the mischief-maker and its eggs, by rubbing in an ointment compounded from storax, an aromatic resin, night and morning, afterwards washing with warm water and carbolic soap. Sulphur ointment is also used for the cure of itch. All apparel worn during the continuance of the complaint should be thoroughly disinfected, or the itch may be thereby communicated.

Acantharia. Means general impurity of the blood, bringing about ulceration or other disorders.

Acerbity. Sour taste to the palate, "roughness" of flavour.

Acetabulum. The hollow in the haunch bone into which the head of the thigh bone fits.

Acetate. A salt formed by the amalgamation of acetic acid with a base. Acetic acid forms the basis of vinegar.

Achilles Tendon. The large ligament or tendon of the calf muscle inserted into the heel bone.

Achor. A scaly eruption of the head, commonly met with in neglected children, and usually known as "scald head" [which see].

Acidity. Sourness, as of the palate or stomach.

Alkalis. The several acids most commonly employed in Pharmacy are referred to under their English names in this dictionary. They exert a solvent action on many of the nutrients, and are otherwise useful, as will be specified.

Alcinia. Implying loss of motion.

Acme. The crisis in disease.

Acne. An unsightly eruption of the face, chest, back and shoulders, usually the effect of impaired digestion, and most commonly troublesome between the ages of fifteen and twenty-one years. It is characterised frequently by disagreeable pimples rising over the glands of the skin whose proper function is the secretion of oily matter, or by "blackheads" sluggishly retained in the glands. These can be removed by pressure or squeezing, when the expressed fatty matter has the appearance of a white maggot. Acne may be overcome by the promotion of healthy digestion, and by frequent use of a reliable antiseptic soap and plenty of water; or it may be remedied by the persistent application of a lotion prepared from glycerine, flowers of sulphur, spirits of wine, and elder-flower water applied nightly before retiring. Acne, simply means a pimple, acne rosacea, one of a rosy colour, acne punctata, a maggot-like pimple.

Acnite.—A deadly poison, the extract of the common Monk's hood or Wolf's bane, the root of which is very like that of the horseradish in appearance. Useful, in carefully calculated doses, in the treatment of fever, neuralgia, sore throat, etc.

Alcalitin.—An alkaloid, the active principle of Acnite.

Acor. Acidity of the stomach.

Acoria. Morbidity of appetite for drink or food.

Acosmia. Loss of colour in the blood.

Acoustic. Impaired hearing.

Acoustic Nerve. The auditory nerve.

Acromania. A form of insanity.

Acropathy. Disease of the extremities.

Acroty. Defective power in articulating sounds.

Actma Racemosa. The Black Snake Root, medicinally used as a sedative tincture in the treatment of muscular rheumatism and lumbago.

Acupressure. Is the endeavour to arrest bleeding by compressing arteries with needles.

Addison's Disease. Wasting disease of the suprarenal bodies situated above the kidneys, usually indicated by unhealthy bronzing of the complexion and by anæmia, a pearly condition of the whites of the eyes, sickness, and loss of appetite. Generally combated by the administration of iron tonics, arsenic, etc.

Adenoid. Glandiform, like a gland; also applied to growths in the nose.

Adhesive Inflammation. Is the process resulting in the union of severed soft parts without the formation of "matter."

Adipose, Fatty. The interstices between the muscles are generally filled, especially in young persons, with cells containing adipose matter, giving plumpness to the parts.

Aëration. The action of atmospheric oxygen

upon the venous blood, converting it, on the lungs, into arterial blood. Any pulmonary ailment interferes with this essential natural process.

Agglutination. Adhesion of the eyelids, induced by the exudation of glutinous matter. Cured by application of a little boracic ointment.

Ague. Is accompanied in most cases by enlargement of the spleen. In the cold stage give thin warm drinks frequently, and apply hot water bottles to the feet, placing the patient between blankets. Sponging the body with tepid water and the administration of cooling drinks should be the staple of treatment in the hot dry stage, and when sweating succeeds, rest and lukewarm draughts to assuage thirst are necessary. Quinine is one of the best preventative and curative agents in relation to ague.

Air. It is essential that the air we breathe continually should be fresh and pure, that is uncontaminated by impurities. Impure air is deprived of some of its life-sustaining oxygen, and increased in the proportion of carbonic acid it carries. Therefore let every apartment be efficiently ventilated. "Let the blessed sunshine in;" open wide the windows to admit "the wind of God," that it may blow away impurities.

Albinism. An abnormal whiteness of the skin, accompanied by light or flaxen hair, and sometimes by pink coloration of the eyes.

Albugo. A disease of the cornea, or horny lens in front of the eye, manifesting itself in "white speck."

Albumen. A chief constituent of all animal bodies, presented in nearly a pure form in the white of egg. Therefrom the chicken during development derives nourishment, and from the albumen in the human blood the tissues are chiefly sustained.

Albuminuria. A disease of the urinary organs, denoted by the presence of free albumen, can be easily detected by carefully boiling a small portion of the voided fluid, or by the addition of nitric acid, either of which will occasion coagulation, as the white of an egg solidifies in cooking. Albuminuria may arise from weak heart action or ailment of the kidneys.

Alcohol. A colourless or highly rectified spirit of wine, a colourless and faintly odorous fluid of hot, pungent taste, constituting the characteristic compound in fermented liquors, and communicating to them their intoxicating properties. Alcohol possesses a stimulating effect upon the human frame, which may be hurtful or otherwise, according to circumstances, but is not necessary to a healthy subject.

Alimentary Canal. The passage from the mouth to the anus, comprising these as the terminals, and the œsophagus or gullet, stomach, and intestines in between. The liver and sweetbread form parts of this system.

Alkali. A term chiefly applied to potash, soda, and ammonia, but besides these, magnesia, lime, strontia, lithia, and barya all possessing alkali properties. Alkaloids are bodies partially resembling alkalies, such as quinine, strychnine, and morphia.

Alopecia. Partial baldness, the falling off of the hair of the head in patches, commonly due to disease or to a description of nervous debility affecting the nutrition of the hair bulbs. It may be allayed by the restoration of nervous tone, and cured by appropriate local remedies.

Aloes furnish an extensively used purgative, acting powerfully upon the colon or large bowel. Generally employed in combination with some carminative or anti-spasmodic agent to prevent griping.

Alteratives. Medicines which act on the blood, changing its character, without inducing disturbances in the intestinal or urinary excretions.

Alum. A compound salt of potash and alumina in combination with sulphuric acid. A cheap and powerful astringent, controlling hæmorrhage and catarrhal discharges, and very valuable in solution as a gargle in cases of sore throat.

Alveolar Process. The bony plates forming borders to the jaws and supports to the gums. These are connected by transverse plates, dividing the space into tooth sockets, each called an alveolus.

Alvine. Pertaining to the intestines, as alvine excretions or discharges, or alvine concretions.

Amaurosis. An affection of the optic nervo

inducing a species of paralysis, which renders the recognition of external objects impossible, and occasions dilation of the pupil. This partial blindness may be brought on by overworking the eye in strong light, by gout, or by excesses of any kind, and requires to be dealt with medicinally without delay.

Amenia, or Amenorrhoea. Absence or irregularity of the menstrual discharge.

Ammonia. A volatile alkali, the basis of smelling salts. Formerly known as hart's horn, from its being produced by burning horny and other animal matter; but now chiefly obtained from gas-tar liquor. It is very valuable medicinally as an antacid and stimulant, also as an expectorant. Frequently applied externally when there is inflammation of an internal organ or tissue, also extensively used internally in cases of bronchitis, congestion of the lungs, fainting, etc.

Ammoniacum. A gum of service as an antispasmodic and expectorant in chronic bronchitis, and as a stimulant in other malades.

Amyl Nitrite. A very powerful antispasmodic, inhaled or administered in angina pectoris, or contraction of the chest.

Anacardiac. A medicine causing vomiting.

Anæmia is a term which expresses the condition of the blood when impoverished. It is caused by defective or insufficient food, bad atmospheric conditions, and constipation, and is more common in females than in males. The symptoms are a pale complexion, colourless lips and gums, and general exhaustion, accompanied by palpitation, headache, and pains in the back and left side. The patient should be given plenty of fresh air and a fair amount of exercise.

A plain and nourishing diet should be adopted, including a moderate proportion of animal food. Regular action of the bowels should also be induced, and with these precautions, steel drops, or iron pills may be administered with advantage.

Anæsthesia. Insensibility to pain, induced by the administration of chloroform, ether, or some other agent, or may be brought on by cold.

Anus. Appertaining to the anus, or terminal aperture of the digestive system.

Anasarca. A kind of dropsy, indicated by the effusion of serous fluid in the membranes, inducing a condition in which pitting is possible, that is, when the flesh will retain the impression of the finger. Usually attributable to disease of the heart or kidneys.

Anchilops. An abscess in the internal angle of the eye.

Anchylosis, or Ankylosis. A contraction or stiffening of the joints.

Anchyloglossum. A contraction of the ligaments of the tongue, bringing about the condition known as "tongue-tied," which requires surgical attention.

Aneurism. A dilated artery, a tumour caused through weakness and distension of an artery by the enclosed blood. May be occasioned by injury or disease. The most frequent seat of an aneurism is the popliteal artery, behind the knee joint, and by far the most dangerous, the aorta, the main artery coming from the heart. Aneurism requires medical treatment.

Angina. Applied usually to a spasmodic malady affecting the heart, often of an agonising nature. Angina membranacea is the scientific denomination of croup, and other angina diseases relating to the tonsils, the uvula, and the throat in various ways.

The most dreaded angina is that of the heart, which is manifested in spasm, occasioning a terrible struggle for breath coincident with acute pain in the region of the heart. In attacks of angina pectoris the sufferer usually exhibits all the symptoms of impending death from suffocation, and the direct cause of the seizure is usually digestive disturbance in the case of a person subject to some one or other of the numerous forms of heart affection. Nitrite of amyl is usually administered to afford relief, either by inhalation, or as a dose in combination with minute proportions of nitro-glycerine, and the effect of these powerful medicines is sometimes little less than marvellous. They reduce the tension of the blood-vessels, and thus relieve the heart's work. Mustard poultices applied to the chest at the seat of pain are often helpful whilst the spasms are being combated. Persons prone to heart

ailment of any character should be particularly attentive to digestive regularity, as a gastric upset is generally the forerunner of angina pectoris.

Asimilation, suspended. That condition in which life is threatened through impeded respiration, the principle causes being drowning, strangulation, or the inhalation of noxious gas. (See Drowning, Gas, Asphyxia.)

Ankle. The strong ligamentous bands controlling the connection with the foot with the leg at the ankle-joint sometimes become sprained or over-stretched by a false step, or slight rupture may occasionally occur from a similar accident. This gives the painful condition usually spoken of as sprained ankle, the proper treatment of which is the application of a soothing yet stimulating liniment, with bannel bandaging to restrain movement and afford support to the part.

Anodyne. A remedy which assuages pain, such as the narcotics and opiates, menthol, cocaine, and belladonna are among the anodynes which act locally.

Antacids. Remedies for acidity of the stomach, such as potash, soda, lime, and their carbonates.

Anthrax. An inflammatory tumour or carbuncle. A dreadful form of anthrax may be contracted in man by contact with diseased animals or their hides, through the germ known as the anthrax bacillus entering the skin by an abrasion or wound occasioning malignant pustule or external anthrax. This affection is known as "Woolsorter's disease," germs gaining admission to the lungs of workers from hair and wool derived from anthrax-infected animals. If this should have reached the severe stage before discovery cure is rare.

Antibillious. Medicines for bilious ailments.

Anticathartic. Remedies for poor blood.

Antidotes should be at hand for use in cases of poisoning, and it is important to remember that alkalies act as such against acids, and acids against alkalies. In every instance where a poison other than an acid has been introduced to the stomach, vomiting should be expeditiously induced by the administration of a strong emetic such as mustard and water or even hot water, and tickling the throat and the back of the palate with the fingers or a feather. The whites of raw eggs swallowed, sweet oil, olive oil, or milk should be given in acid or corrosive poisoning to protect the throat and stomach from the burning effects. In ether, chloroform, or chloral poisoning, no chemical antidote is of avail, but ice may be introduced advantageously to the rectum, and cold water be dashed over the head and chest of the sufferer, and artificial respiration promoted. Where opium or morphia poisoning is evident, say, through overdoses of soothing syrup or powder, pargoric or laudanum hot baths are of great value, with copious draughts of strong coffee, and the utmost endeavour should be made to overcome drowsiness by forcing the patient to keep moving or walking about. On the contrary, absolute quiet is essential in nuxvomica and strychnine poisoning, and mustard and water emetic or sulphate of zinc (20 grains in water) administered. Gelatinous drinks, with alternate doses of soap-suds, are often serviceable in copperas and cobalt poisoning, and strong liquid mucilage with flour and water accompanied may be administered where carbolic acid is the cause of mischief. Milk and white of egg, with gelatinous draughts, are beneficial in poisoning induced by mercury or its salts; ammonia should be given in water as a first attempt to cope with prussic acid poisoning; lime-juice, magnesia and soap-suds may be tried where the baneful agent is known to have been aqua-fortis, vitriol, or oxalic acid; and strong salt and water should be forced down the throats of sufferers from nitrate of silver swallowing. Rat-poison or arsenic having been taken, flour and water, milk, sweet-oil, and lime-water may prove corrective; while strong alkalies such as potash infusion, ammonia, hartshorn, and cleansing lyes are best counteracted by vinegar or lemon-juice. No form of oil should be given in phosphorus poisoning. Astringent infusions, with very strong tea as a handy form thereof, together with starch-water, are often helpful in antimony or tartar emetic poisoning, or when iodine has been taken. For corrosive sublimate, lead poisoning, or where any of the usual insect-destroying powders have found their way into the stomach, large and frequent draughts of

milk or the whites of eggs may be given, and this treatment will often afford relief in sugar of lead poisoning cases. No delay should be made in securing competent medical assistance where poisoning symptoms are apparent.

Antimony. A mineral medicine formerly most extensively employed in fever cases, and still of value in the treatment of pleurisy, pneumonia, and chest complaints generally. It produces a powerful effect upon the heart's action and has been a great deal resorted to in criminal poisoning cases.

Antipyresis. Remedies which lower the temperature in fever.

Antipyria. A drug in considerable demand for the relief of neuralgia and other ailments. An overdose may induce depression of the heart's action.

Antiseptic. Opposing or preventing putrefaction. The term in pharmacy comprises all those agents which have a deterrent or destructive effect upon the micro-organisms that give rise to many diseases. Antiseptic dressings are invaluable in the treatment of every description of wound. Iodoform is much used in hospital treatment, and other antiseptics in common medical employment are carbolic acid, permanganate of potash, oil of eucalyptus, perchloride of mercury, boric acid, chlorine, thymol, and aristol.

Anus. The lower orifice of the intestines, controlled by a powerful sphincter muscle. The anus is not infrequently the seat of troublesome and dangerous disease, including fissure, and prolapsus of the mucous membrane of the bowel, also of piles.

Aorta. The great artery rising from the left ventricle of the heart, and distributing the pure blood to the various arteries of the body.

Aperient. Medicine of a laxative character. Some of the chief are castor oil, rhubarb, croton oil, jalap, senna, colocynth, and Epsom salts.

Aphasia. Speechlessness from brain disease.

Aphonia. Dullness of voice due to paralysis of the vocal cords, or inflammation of the larynx.

Apnoea. Loss of breath, suspended respiration. It may result from external causes, or be produced by lung or heart disease, and very frequently immediately precedes death.

Apoplexy. A person seized with this distressing and dangerous disease should be removed to a cool and efficiently ventilated apartment, and have the clothing loosened or removed and the head kept elevated. Cold applications should be made to the head immediately, and quick-acting purgatives administered, with the addition of emetics should the stomach be known to be overloaded. The scalp may be blistered for relief, and bleeding be resorted to in case of extreme turgidity of countenance; this, however, ought to be left to the surgeon. Apoplexy manifests itself by the person seized falling down after experiencing severe pains in the head, and becoming insensible. The face is more or less flushed, sometimes to purpleness; there is a full pulse, but usually slow. These symptoms are succeeded by vomiting, and partial or complete paralysis; and there is cold perspiration and heavy stertorous breathing. This always alarming malady is generally due to congestion or rupture of some blood vessel in the brain. No stimulants must be given. Absolute rest is essential. Apoplexy may be cerebral, pulmonary or sanguineous.

Appendicitis. Inflammation of the curious vermiform appendix or blind sac at the junction of the larger and smaller intestine, frequently caused by the lodgment of irritant indigestible substances taken with the food into the alimentary system when it is irregular in action through abnormal conditions. When appendicitis becomes acute it is now usually made the subject of surgical operation, even to the excision of the appendix, which performs no known useful function.

Aptha. The thrush, a disease indicated by small white spots in the mouth, and on the throat and tongue, caused by an acid condition of the alimentary canal, common in infants, and not infrequently a precursor of death in persons of mature years. Thrush is a mould growth. Borax is a useful local application; and the condition of the stomach should be rectified.

Areus Sanilis. A pearly opacity encompassing

the cornea of the eye in aged persons, sometimes spoken of as "glazing."

Arcetia. Opening the pores, descriptive of medicine designed to promote perspiration. Arcetia is the term applied to the interstices of the cellular tissues, as also to the "halo" or dark circle surrounding the nipples of the female breast in pregnancy.

Aristol. A very useful antiseptic, resembling in its effects iodoform whilst being free from the powerful odour of the latter. It should be kept away from the light to preserve its beneficent qualities.

Aristol. The Leopard's Ban, a plant the leaves and root of which afford medication for bruises, and may be advantageously employed internally in the treatment of typhoid.

Arsenic. Arsenious acid, or white oxide of this metal, a very deadly poison, is, when judiciously employed, most valuable in pharmacy. It is used in the treatment of skin diseases, neuralgia, and ague. Arsenic is a very volatile metal, and may produce injurious effects through the exhalation of its fumes.

Artery. A vessel conveying pure blood from the heart to the capillaries, from whence it is returned to heart and lungs by the veins. Arterial blood, very bright red in colour, flows in pulsations or waves, differing from venous blood by having undergone on the lungs the oxidising action of the air. From any injured artery the blood escapes in spurts corresponding to the beats of the heart, and compression between the heart and the wound must be made until surgical assistance has been secured. It is highly important that arterial hemorrhage should be stauncher as quickly as possible, for if the artery severed be large there is great danger of bleeding to death. In the case of injury of this character occurring in the limbs a bandage should be at once twisted as tightly as possible between the wound and the heart.

Arthritis. Gout, or analogous ailments of the joints, sometimes characterised by chalky concretions, and always occasioning acute pain, spasmodic or continuous. (See Gout.)

Ascaris. A species of intestinal worm, known as a round worm.

Ascites. Abdominal dropsy, usually the effect of exhausting organic disease, either of the heart, kidneys, or liver; generally relieved by surgical "tapping."

Asphyxia. When breathing has been suppressed by the inhalation of poisonous gases, by hanging or by other methods of strangulation, by apoplexy, or by syncope, artificial respiration should be promptly resorted to. The procedure is indicated under the head of drowning, as necessary in that form of misadventure; generally it is similar in all asphyxia cases, save that the preliminary of expelling water from the lungs is of course only requisite after immersion. False teeth should be removed, and the whole body rubbed briskly, pressure being applied and withdrawn alternately both on the back and at front below the lungs. Rotate the body gently on the right side. Then let the legs and arms be bent and straightened; all the while the patient lying on the floor or a couch with the head slightly raised. The object of every endeavour is to restore circulation and breathing by assisting the inanimate body to do what it has lost the power itself to accomplish. Never relinquish these humane efforts until the spark of life has unmistakably fled or success has been achieved.

Asthma. A spasmodic affection of the bronchial tubes, is productive of extreme difficulty in breathing. Persons subject to asthma often find themselves freed from suffering in one neighbourhood than another. They require careful dieting and constant attention to the regular action of the digestive organs. When the spasms are particularly troublesome, relief may often be obtained from inhalation of the fumes of burning blotting paper previously saturated with a solution of nitre, or a few drops of chloroform upon a handkerchief may be placed to the nostrils. A compound liniment of belladonna, camphor, soap and oil, applied by friction to the chest, is comforting.

Astringent. Literally means "that which binds," and the term is applied to those substances which occasion contraction of the tissues when applied locally. The most commonly employed vegetable astringents

are those containing tannin, such as oak-galls and bark, catechu and kino. Mineral astringents include alum, salts of iron, sulphates of copper, and zinc, nitrate of silver, acetates of lead, and sulphuric and other acids.

Ataxy. Irregularity in the functions of the body, arising from disease or disturbance, as of the pulse, when it becomes paroxysmal, or the gait, when it is unsteady through paralysis or from some other cause, which gives the painful condition called "Locomotor ataxy." Ataxy literally signifies "want of order."

Athletic Training. Athletic exercise, indulged in with moderation, is good generally, more especially to the young of both sexes, as its tendency is to increase the powers of endurance by improving the muscular system. Regular habits and attention to dietary in connection with athletics constitute the "training" which produces "form." The best food to take is plain and unfattening.

Atrophy. Wasting away, general or local. General, as in consumption or incurable cancer; local in serious bowel or nerve trouble.

Auditory Canal. A continuance inwards of the trumpet of which the ear may be considered the mouth. It ends internally in the tympanum.

Auricle. The external ear. The term is applied also to the two upper cavities of the heart, leading to the ventricles.

Auscultation. Judging of the progress or existence of disease in the lungs or thorax by listening to the breathing or by the use of the stethoscope.

Axis. The second vertebra of the neck.

Bacillus. A rod-like, microscopic organism, representing a family of germs with power of multiplication to an enormous extent within the human form, thereby propagating disease.

Bacteria. These are micro-organisms which, upon introduction to the circulation, may produce certain specific effects. They are chiefly fungoid, but can be readily cultivated in pure and other substances in the laboratory, and are distinguishable from each other. Bacteria are often useful in removing decaying matter, as in the bacterial treatment of sewage.

Baldness. Generally arises from some constitutional cause or hereditary tendency, and is immediately due to a weakening of the follicles of the hair. Its progress may sometimes be retarded by stimulating lotions.

Balneaatio. The act of bathing; the treatment of disease by baths of various descriptions.

Bandages. For any part of the body requiring support, need careful folding and adjustment. They may be made from old linen, in strips from sheets or table cloth, flannel, gauze, calico, or elastic web, as is best suited for the immediate purpose.

Barfotee. The practice of allowing children to wear sandals upon unstockinged feet has found increasing favour in the summer time with many heads of families, both when at the seaside and in town. It is a commendable one. There is less danger of cold-taking if the blood flows freely in the uncramped extremities than when prisoned by boots.

Bathing is very necessary in health and, when possible, in sickness also; for without cleanliness the functions of the body cannot be properly fulfilled, and were washing more frequent than it is, and more thorough, there would certainly be less disease to deal with. There are hot, tepid, and cold baths, both simple and medicated; the latter for specific curative or preventative purposes, and these can be used in different ways, as the plunge, spray, shower, or sponge bath. Vapour and mineral baths are more complicated, but they are nowadays when necessary within the reach of most people. Open-air bathing is beneficial to all who do not receive therefrom too much shock, and sea baths are very pleasant in warm weather, as well as healthful. Turkish baths are usually of value to sufferers from rheumatism, but should not be adventured upon by persons subject to heart affection, except under medical advice.

Bed. For the young and healthy a firm mattress forms the best bed; for the feeble and aged, who have more difficulty in maintaining a comfortable and sufficient temperature, a softer bed is preferable.

Bedrooms ought to be efficiently ventilated night

and day to secure healthy sleep. Do not stuff up the chimney, which is a capital safety valve, and secure the admission of fresh air through the window sashes constantly by an arrangement which excludes draught. The less of furniture or other impediments there be in a bedroom the better.

Bed-sores should be guarded against in lingering illness; the provision of a "water-bed," or pneumatic cushions, which compel equal pressure, being capital preventatives. When a bed-sore threatens to form, there should be frequent and gentle washing of the part with warm water, and careful drying with a soft towel, afterwards dabbing with eau-de-cologne or good whiskey.

Beef. Good ox-beef is the most strengthening of all animal food, wholesome, nourishing, and easily digested by healthy and vigorous persons.

Bee Stings should be extracted as quickly as possible, and the injured part treated by an alkali, such as bicarbonate of soda.

Belladonna. The "deadly nightshade," a plant producing a powerful and poisonous narcotic, which has numerous uses medicinally as a soothing agent.

Benzole Acid. Used medicinally and in perfumes, and present at times in the saliva and excretions of the bladder. Obtained for pharmaceutical purposes from guai benzole.

Biceps. A muscle having two distinct heads or origins, as the biceps of the thigh or the biceps of the arm.

Bile. The secretion of the liver which aids in the assimilation of the fatty portions of the food. If there be defective action of the liver, then will follow a tendency to allow the biliary products to accumulate in the system, commonly called the overflow of bile, or "a bilious attack." Constipation is a frequent cause of biliousness, contributing to fecal absorption in the lower bowel from the retained matter contaminating the blood, and giving rise to the sallow complexion of the bilious subject. Free purgation should be secured in such cases; and a sluggish liver should be stimulated by calomel, taraxacum, podophyllin, or some similar medicine. Careful dietary, little flesh food, with sufficient open-air exercise, should keep healthy persons free from bile trouble.

Bismuth. Is a metal a good deal used in cosmetics and medicinally, especially as an alleviate of dyspepsia. It is very useful as a powdered carbonate or subnitrate in heart-burn, water-brash, and may be obtained at the chemist's in lozenge form.

Bite of Dog, or other Animal. Cleanse the wound as well as possible, ligaturing tightly between the injured part and the rest of the body if possible, and cauterising should virus be suspected. This should be done with lunar caustic or any clean iron or steel article at hand rendered white hot. The wound should first be well sucked if the attacking animal's bite be venomous in any way, and the surrounding flesh ought to be promptly cut away with a sharp knife in a case of known great danger before the cautery. A spirituous stimulant may also be given to the injured person in sufficient quantity to induce mild intoxication. This applies to snake-bite also.

Bitters. Various kinds of bitters, infused in spirit, are made use of by many persons for the purpose of stimulating the appetite. Most of these are of vegetable extraction, derived from the gentian, orange etc., and though of some little value when applied medicinally in a judicious manner, as appetisers, their habitual use is to be deprecated.

Bladder. A membranous bag containing fluid in animal bodies such as the urinary and gall-bladder. The former is subject to many affections, arising chiefly from cold or neglect. If over-distension be permitted, there may be rupture. Irritability of the mucous membrane of the bladder may arise from cold or a disordered condition of its fluid contents. Stone in the bladder is a frequent cause of excruciating pain in the organ, and usually requires a crushing or cutting operation for its removal. The presence of this malady is often indicated by the passing of blood after exercise, or by retention caused by the accumulated "gravel" obstructing the water passage. A hot sitz bath will frequently afford relief; but stone in the bladder is an

allment calling for surgical attention. Weakness of the organ, indicated by inability to retain its contents, frequently occurs in the young and the aged, and may be amended by the employment of suitable tonics. See also "Gall Bladder."

Bleeding. Bleeding from any wound in spurts indicates severance of artery, and should be at once arrested by tight bandaging between the injured place and the heart, if this be possible, with the application of ice or other cold substances; the aid of a surgeon to tie up the artery being obtained immediately. Should external ligaturing be rendered difficult by the location of the wound a compress should be made above as well as over it. Bleeding from a vein proceeds in a continuous stream, and hemorrhage of this description is sufficiently dangerous when permitted to proceed for any considerable time profusely. In the case of a varicose vein bandage both above and below the wound. Alum, tannin, and all astringents are good styptics or blood staunchers. Tannin, or alum, or cotton wool stuffed up the nostrils will often stop troublesome nasal bleeding.

Blister. A watery swelling under the skin; also a plaster to produce the same of set purpose, generally for the relief of internal inflammation. The best counter-irritant for this purpose is cantharides.

Blood is a highly important medium of human and animal life. It consists of arterial blood, which has been oxygenated on the lungs; and venous blood, loaded with carbonic acid gas, and not having received aeration. Blood corpuscles or globules are white and red, the latter giving to the blood its brilliant colouring and containing iron. The red corpuscles carry oxygen to the capillaries from the lungs and bring back carbonic acid gas from the system to the lungs for expulsion. The white corpuscles wage constant war against malignant bacilli, bacteria, and disease-promoting microbes generally. The colourless fluid in which these corpuscles float is called the serum or liquor sanguinis. Over three-fourths of the composition of blood is water.

Bloody-flux. A painful form of dysentery, in which blood discharges accompany the feces.

Blue Disease. Cyanosis, a dangerous form of heart trouble, in which the whole surface of the body assumes a bluish tinge.

Blue Pill. The common name of a remedy much employed for liver disorders, in connection with a less powerful purgative. It contains mercury.

Boil. A painful affection of the skin, usually incident to a low state of the general health. It is produced by a minute organism which locates itself in the hair follicle for the propagation of its species, occasioning suppuration in the immediate environment and a more or less extensive superficial pustule through which the purulence is discharged. An unduly irritated boil may develop into carbuncle. Boils are best left alone to run their course, attention being turned to the improvement of the impaired condition of body they indicate; but during their continuance the eating of oranges will be found to have beneficial effect.

Bones. The bones of human form are composed of animal and earthy matter, the latter, in maturity, much predominant, and composed mainly of phosphate of lime. Bone affords the necessary strength and solidity. The animal portion, gelatinous, yields vitality and prevents brittleness. In infancy and childhood the bones are soft, developing towards the perfect condition gradually.

Borax. The borate of soda, used as a cooling medicine, frequently in conjunction with honey or glycerine, for the mouths of children in thrush and for sore throat.

Brain. A tumour at the back of the eye.

Brain. The brain is the great nerve mass enclosed within the skull, serving as the headquarters from which the spinal marrow and all the nerves which permeate the body take their start and governance. It is a complete and delicate organisation, and though well fortified within the cranium, liable to sustain injury from accidental violence or by overwork. Concussion of the brain is a condition resultant from a severe blow occasioning unconsciousness without apparent organic mischief within the brain.

Breath. Breathing through the nostrils is the natural and desirable method of respiration, and perfect repose is only secured when the mouth is closed. All crooked or restrained positions render respiration difficult. Irregular breathing denotes either an unnatural position of the body, or some impairment of the respiratory organs. The exhalation of offensive odour from the breath may arise from gum ulceration or decaying teeth, from disease of the mucous membrane of the air passages, from disordered digestion, or from impurity of the blood.

Bright's Disease. Denotes an inflammatory affection of the kidneys indicated by the presence of albumen more or less excessively in the urine. The disease may be very serious, and its treatment calls for the exercise promptly of medical skill.

Bromine is an elementary substance, similar to chlorine and iodine, and can be obtained 1.0m bitter, the liquid residue secured after evaporating sea-water, but is now generally manufactured from the bromides obtained from crude carnalite. It forms brown fumes and bromates.

Bronchi. The branches of the windpipe, or ramifications of the air tubes of the lungs.

Bronchitis is an inflamed condition of the bronchial membranes. It is usually induced by cold, but may occur as a complication in the course of acute febrile attacks, such as typhoid. In the commencing stage the mucous membrane of the bronchial tubes is often so inflamed as to occasion great difficulty of breathing and painful spasm. When this subsides and the secretion of mucus is resumed, it becomes sometimes so excessive as to set up more or less continuous coughing. Should the inflammatory condition spread downwards through the capillary branches of the bronchi and to the lungs, serious symptoms will speedily supervene. Relief may be obtained in many cases by the application of linseed or mustard poultices to the chest and back, these being permitted to remain on half an hour at a time and renewed as necessary, the patient being kept warm in bed. Expectoration may be rendered less painful by the administration of speaccharia, or antimonial wine, quills or pargoric.

Bronchocele, or Goitre, is an enlargement of the thyroid gland, often called "Derbyshire neck." It is commonest in districts situated on mountain limestone, and is caused by drinking over-hard water. The cysts or swellings sometimes reach large dimensions, and occasion very considerable inconvenience, though they are rarely accompanied by actual danger to life. The accumulated fluid may be drawn away from the cyst to afford local relief, and iodide of iron syrup often proves beneficial.

Bronchos is a term signifying suppression of the voice, as the result of cold or catarrh.

Bronchotomy means incision of the larynx or trachea, made for the obtention of suffocation in quinsy, cancer, or other continuously obstructive condition of the passages. It is only resorted to as the last hope of saving life.

Broom. A species of genista, is a common plant, the young shoots of which yield, upon boiling, an infusion useful in the treatment of dropsy, being powerful stimulants to the functions of the kidneys.

Bruises may be rendered less painful by the application of diluted ammonia, or by bathing with spirits and water, also by the use of ice. Belladonna, aconite, and opium liniments painted upon the injured part will usually afford relief, but must not be employed when the skin is broken.

Bruit signifies the sounds in the chest detected by the stethoscope, indicative of the presence of disease.

Bubo, a swelling or enlargement of certain glands arising from an internal sore, and usually tending to suppurate. May be treated as an ordinary abscess, or, if there be no suppurating, painting with iodine will often afford relief.

Bulla. A large vesicle or piece of cuticle charged with serum or watery fluid, raised by blistering or burning.

Bunions are painful swellings over the joints of the toes, and particularly with regard to the great toe. They are due to inflammation of the joint capsule. Hot fomentation will afford relief, but this

removal of the cause is necessary to prevent recurrence.

Euphthalmia. Dropsy of the eye.

Burns. Cover with powdered soda, and lay over, or bind tightly with a wet linen cloth, to "take the fire out." Next dress with white of egg or olive oil and secure the injured part against friction. Lime water and permanganate of potash also make soothing dressings. Carron oil used for burns consists of equal parts of linseed oil and lime water.

Gastrostomy. A deranged and vitiated condition of the system, indicating extensive disease.

Cacoecia. An ulcer of an incurable character.

Cæcum. That portion of the lower bowel where the ileum ends, a wide pouch-like vessel, generally about two and a half inches long with the appendix given off from it.

Calculus. A stone or hard concretion in the bladder, kidney or urethra.

Caligo. A term applied to various diseases of the eye. *Caligo lentis* signifies cataract; *caligo humorum*, blindness from defect in the humours of the eye; *caligo corneæ*, opacity of the cornea; *caligo palpebrarum*, blindness from affection of the eyelids; *caligo pupillæ*, obstructed pupil.

Calisthenics, as distinguished from the more strenuous gymnastics or athletic exercises, may be considered to constitute an admirable method of promoting and maintaining bodily health and vigour.

Calomel. The sub-chloride of mercury, employed in medicine for salivation and other purposes.

Caloria. The heat generated by the active functions of the body, dependent upon the changes due to the digestion, assimilation, respiration and the circulation of the blood.

Camphor. A solidified essential oil, much used medically as a stimulant, obtained commercially from the *Camphora officinarum*.

Cancer. A scirrhous tumour, sometimes ulcerating and enlarging to an enormous size, and assuming a malignant character. Cancer is considered in many cases to be of hereditary origination. It occurs in various parts of the human body, and is much more frequent in females than males, rarely making its appearance before the age of thirty. It is only in its first stages that true cancer can be eradicated, if at all, and that for the most part by surgical excision. Medical scientists are devoting much attention to the study of this terrible scourge of humanity.

Canker. Small ulcers occurring in the lips, mouth, gums, and cheeks of ill-nourished persons, chiefly children. These sores are of a gangrenous and offensive character, and require drastic surgical and antiseptic treatment locally, in conjunction with stimulative and nutrient dietary.

Canthus. The junction or cavity at the extremity of the eyelids.

Capillaries. The minute blood vessels forming the connecting links between the arterial and venous systems. Capillary literally means "hair-like." These blood vessels are sometimes only one five-thousandth part of an inch in diameter, and differ from the smallest arteries in having only one coat, as against the three exhibited in the arterial system. The capillary may be observed in the whites of the eyes when blood-shot, having become gorged with red globules.

Carbide. A combination of carbon with any other elementary body; thus steel is carbide of iron.

Carbolio Acid. A colourless oily fluid, prepared from coal-tar, and invaluable as a deodoriser and disinfectant. It has the effect of masking all disagreeable odours and of arresting putrefaction.

Carbolised Oil. An invaluable lotion for burns and scalds, prepared by the addition of one part of carbolic acid to about sixteen to twenty of olive oil.

Carbon. Pure charcoal, only existing as such in the diamond naturally, is a chief constituent of all animal and vegetable bodies, from which it is separable by heat, sulphuric acid, etc. It is a powerful deodoriser and absorbent of noxious gases, and may be taken advantageously in powdered form or in biscuits by sufferers from flatulence or indigestion.

Carbonic Acid, or Carbon Dioxide is a gas produced by the amalgamation of two equivalents of

oxygen with one of carbon. Found in underground workings and deep wells, as "choke damp"; other names: "mephitic gas," "fixed air," "aerial acid," "heavy air." A deadly poison in inhalation, but a valuable stimulant administered in the stomach in discreet doses.

Carbuncle. An inflammatory tumour or boil. A virulent superficial affection, which may develop from a simple pustule, or boil, but is invariably a sign of low general condition. This results in impaired vitality in portions of the skin, which become indurated and gangrenous. Incision and cleansing of the vitiated tissue is necessary, together with improvement of the bodily health by tonic treatment.

Cardiac. Implies something pertaining to the heart, and pharmaceutically signifies a stimulant exciting action of the stomach and consequently of the circulatory system by the heart.

Cardialgia, or Heartburn, an ailment of the stomach, causing temporary interference with the action of the heart indicated by a burning and acrid sensation both in the stomach and at the top of the gullet. (See *Heartburn*.)

Carditis. An inflammatory affection of the heart tissue. Cardiac inflammation is generally confined to the outer covering of the heart, or the lining membrane which it beats, when it is styled pericarditis. The living membrane of the heart itself may also become inflamed from various causes, which gives the condition called endocarditis. Both are usually the outcome of rheumatic disease, and frequently follow rheumatic fever.

Caries. Ulceration or mortification of bony tissue, or of the teeth, usually followed by decay of the substance affected. Muricite of calcium, administered perseveringly, coincidently with a generous nutritive dietary, will often be found remedial in caries; but surgical attention is usually requisite.

Carminative. Anti-spasmodic, expelling wind from the system, a remedy for colic or flatulence. Hot water, ginger, peppermint, and pennyroyal are amongst the simplest of carminatives.

Carotid. The two large arteries of the neck, conveying blood from the heart, and situated on either side of the windpipe.

Carpologia. A very low state of the system in disease, indicating all but complete exhaustion of the physical and mental powers.

Carpus. The wrist bones, eight in number.

Cartilage. Gristle, an elastic substance attached to the bone, pearly-looking and affording gelatine on boiling. The cartilages cushion the bones at the joints, and move over each other without friction through the action of synovial fluid secreted in their immediate vicinity.

Cascara and Cascarella. The bark of an American species of cinchona, used as a tonic either in tincture or infusion; also as a laxative.

Caster Oil. A valuable purgative obtained by pressing the seeds of the Ricinus communis, one of the Spurge. It usually acts upon the bowels very quickly and thoroughly, and may be administered with good effect in infancy and old age.

Catalepsy is an alarming condition of suddenly suppressed consciousness, an accompaniment occasionally of hysteria in females. It may be of considerable duration, when it is usually called "trance." The condition of amnesia to the nostrils, the injection of ether or brandy under the skin, the friction of the body, or an electric shock, have all been tried successfully in catalepsy.

Catamenia. The menstrual flow, irregularities in which should be immediately noted, and if not ascribable to natural causes, receive medical attention.

Cataract. An opacity of the crystalline lens of the eye, occasioning blindness. Should the ailment arise from disease of the lens itself, it is called true cataract; an external growth in front of the lens constitutes what is known as false cataract. Usually an accompaniment of old age, and very often amenable to operative treatment in the early stage.

Catarrh. Increased secretion of mucus from the membranes of nose, ear, bronchia, stomach, alimentary canal, or urinary passages. Most catarrhal ailments

are occasioned by exposure to cold, and the term means simply "a running down." The "common cold" in the nose or chest is the most frequent of catarrhs, whilst the catarrh of a marked and epidemic character is generally characterised as influenza. Catarrh of the air passages may be remedied, when not of serious extent, by inhalation of eucalyptus or methyl-impregnated steam.

Cathartics. Medicines which promote purgation, such as castor oil, cascara, Epsom salts, aloes, &c.

Catheter. A slender tubular bougie, introduced through the urethra into the bladder to relieve that organ when natural efforts fail; sometimes made of india-rubber or gum elastic, sometimes of silver. This instrument should always be cleansed by antiseptic applications before use, and employed with great care, lest injury be inflicted upon the delicate urinary canal.

Cautery. Burning, or otherwise acting upon a morbid part by heat, caustic, etc. A white-hot iron may be applied in emergency to a dangerous bite or poisoned wound. Lunar caustic, the fused nitrate of silver, is perhaps the best and most commonly known agent of this character; other caustics are nitric acid, chloride of zinc, acetic acid, caustic potash or soda, and caustic lime. Salicylic acid and chromic acids are often employed for the purpose of eradicating corns and warts.

Cellular. Signifies consisting of microscopic cells. Most animal and vegetable structures are cellular in form, hence we have the term "cellular tissue," indicating the membranous network filling up the interstices between the various organs of the human body, composed of numberless cells, crossing each other, and containing communicating intercellular spaces, kept soft and moist by a watery vapour exhaled from the minute arteries.

Cerebrum. The upper brain, the organ upon which depends the manifestations of will, intelligence, and memory, and which governs the processes of the nervous system, these in turn directing all muscular action. Singularly enough, the cerebrum, or centre of the whole nervous structure, possesses itself no power of sensation, and may be injured, and even divided, without sense of pain being experienced, though functional derangement of will, of course, quickly ensue. Diseases of, or injuries to, any part of the cerebral structure demand the most skillful and instant attention.

Cerumen. the yellow waxy secretion of the external ear. In aural catarrh, the cerumen sometimes accumulates and hardens to an extent occasioning temporary deafness. The introduction of a little warm glycerine or oil followed by syringing with tepid water, in which a little antiseptic soap has been dissolved, will usually remove the trouble.

Cervical Vertebrae. the seven upper vertebrae of the spine, situated at the base of the skull and immediately below, in the neck to the shoulders. Cervical muscles and vessels generally are those of the neck.

Chalkstone. a calcareous concretion deposited in the joints, particularly of the hands and feet, of sufferers from gout, composed chiefly of urate of soda. Those of a gouty tendency should eschew soda therefore; lithia or potash being suitable antacids for their assimilation.

Chancre. a syphilitic ulcer.

Chapped Hands are generally the result of careless drying in cold and windy weather, or may be occasioned by the use of soaps containing an excess of alkali. Some skins are particularly susceptible to chapping, and lanoline is generally a very useful application in such cases. The selection of a reliable emollient soap, such as Pears', for washing purposes, will usually be found effectual in the prevention of painful chapping, even during severe frost.

Charcoal is a splendid deodoriser and disinfectant, and a capital air and water filter. It absorbs many impurities in a most remarkable degree, and in poisoning from morphia, opium, and strychnine, if administered powdered in water, it will take up the noxious agent rapidly and render it inactive.

Chest or Thorax. the cavity containing the lungs, heart, and large blood vessels, the gullet and

windpipe also passing through it. Its upper portion is bounded by the neck, and it is separated from the abdomen by the diaphragm, a large muscle of breathing. The chest is the seat of many ailments referred to separately or in connection with the organs affected. Water in the chest, technically termed hydrothorax, is a resultant of pleurisy, effusion into the cavity having occurred. Chest development, especially in the young, may be healthily promoted by athletic and gymnastic exercises, judiciously pursued.

Chicken Pox. A mild zymotic disease, common to children, and usually occurring only once in a lifetime. Usually preceded by a feverish condition, the eruption consists of white-headed pimples on the breast, shoulders, face, scalp, and body generally, affecting also at times the tonsils and the palate. On the third or fourth day the white vesicle dries up, leaving a scaly crust which soon falls away. If the pimples are not irritated they leave no mark behind; but if scratched or rubbed by the patient, they will sometimes ulcerate and result in slight pitting. Carbolic acid applied to the parts which itch most painfully will allay the irritation.

Chilblains. These are really slight frost-bites, the effect of them being a painful itching of the part affected, with more or less inflammation. Persons rheumatically disposed and such as are of a weak physique or "below par" in general health are more liable to chilblains than others. Tincture of iodine is sometimes applied successfully to affected feet or hands, but the best lotion is that prepared from carbolic acid, one part carbolic acid to sixteen of ointment.

Chloral. Is a useful soporific when taken under medical advice in specific cases; but used indiscriminately or to excess it is most mischievous. It has a very depressing action on the heart.

Chloralamide. Is employed occasionally as a sleep-inducer in insomnia; its moderate employment for hypnotic purposes is not usually productive of injurious after-effects.

Chlorate. A salt formed with chloric acid and some base, as chlorate of potash.

Chloride. A combination of chlorine with a base; thus chloride of sodium is common salt.

Chlorine. An elementary body of great bleaching power. United with lime it forms the chloride of lime employed as a disinfectant and whitening agent in laundry work and many manufactures.

Chloroform. A fluid obtained by distilling chloride of lime with alcohol or methylated spirits, largely employed to produce insensibility to pain during an operation. Carefully administered it may be safely used even with young children, and is very valuable in arresting infantile convulsions, but of course it should never be given save by a medical man.

Chlorosis. Or "green-sickness," a distressing form of anaemia, generally the resultant of prolonged constipation in young females. Its principal characteristic is a greenish hue of the skin, which accompanies extreme weakness and suppression of natural menstruation. There is heart palpitation and disturbed repose, with a vitiated condition of the blood. The restoration of regularity in the action of the bowels, plenty of fresh air, exercise, and the administration of iron by way of tonic, constitute the essential treatment of chlorosis.

Cholera is a disease, in its worst or Asiatic form, of a dreadful character. Choleric, the English variety, is a milder but sufficiently distressing malady; cholera morbus has produced epidemics of much fatality. Sanitary science has latterly, however, materially lessened the prevalence of this Oriental scourge, which is due to the presence of a malignant micro-organism within the human body. This germ is called the comma bacillus, because of its shape. Locating itself in the alimentary canal, it quickly produces violent symptoms, which develop with amazing rapidity. British cholera generally arises from the eating of unripe or unsound fruit, and should be combated by clearing out the bowels with aperients suited to the strength of the patient.

Chorea. A disease causing irregular and uncontrollable motion of the muscles and limbs, incidents

chiefly to children of rheumatic tendency. Generally called St. Vitus's dance, which see.

Chromic Acid. An acid formed by the union of the metal chromium with oxygen. Its salt, the bichromate of potash, is extensively employed in medicine; and the effects of the acid when applied to warts on the hand and face are very marked. Great care should be taken in applying the acid not to touch the healthy skin in the neighbourhood of the objectionable growth, or the effect will be most painful.

Chyle. A milky-looking fluid produced during the digestion of food, absorbed by the lacteals, and added to the blood. It is elaborated from the chyme after it has passed into the stomach and been acted upon by the bile and pancreatic fluid in the duodenum and become emulsified.

Chyme. The condition of food after it has undergone the solvent action of the gastric juice of the stomach, immediately precedent to its conversion into chyle.

Cicatrix. The scar or mark left by a healed wound, or, more properly speaking, the substance replacing destroyed skin, either external or of the mucous membrane. It does not possess the vitality or the appearance of the original skin, and is more susceptible to injury, and sometimes contracts and produces deformity.

Cilia. The hairs on the edges of the eyelids, also the eyelashes.

Gilosis. An involuntary spasmodic agitation of the eyelids.

Circulation. The passage of the blood from and to the heart throughout the body, by means of the arteries and veins.

Cirrhosis. A disease of the liver, causing deformity and general change of physical structure.

Citrate. A salt of citric acid. The citrate of iron and quinine is very much employed as a tonic.

Clavicle. The collar-bone, frequently the seat of fracture, and at times presenting very considerable difficulty in setting and retaining in position.

Clergyman's Sore Throat. A peculiar condition of throat and larynx in public speakers and singers, brought about by prolonged and continuous straining of the vocal chords. There is hoarseness or loss of tone in the voice, partial or complete, and catarrh of the mucous membrane; and the ailment occurs most frequently in persons of rheumatic tendency. Rest is imperative, combined with inhalations of eucalyptus, creosote, etc., and coincident with tonic treatment of the system generally.

Climacteric. Literally a progression, but generally applied to a supposed critical period or change of life.

Club Foot. A deformity due to contraction of one or more of the tendons connected with the muscles governing the motion of the foot. Usually in early life this disfiguring condition can be remedied by a simple surgical operation.

Clyster. An injection into the anus for promoting evacuation in obstinate costiveness; occasionally used as a partial means of affording nourishment.

Coagulation. The change from a fluid to a solid state. The term is usually applied to the clotting of blood which has flowed from a wound and come into contact with a foreign substance. In such circumstances the globulin and liquor sanguinis of the blood so act upon each other as to produce fibrin, which is the composition of coagulium, or blood clot.

Cocaine. A crystalline substance prepared from the coca leaf, and productive of local anesthesia. Useful in the treatment of piles, toothache, and diseases of the eye; and has been largely employed in optical surgery and operative dentistry.

Cod Liver Oil. A very valuable heat-producer and nutrient; remedial in consumption, rheumatism, and scrofulous disorders. Combined with malt, it is less nauseous than when crude, and more easily assimilated.

Colicolum. The meadow-saffron, a specific for the gout, and otherwise medicinally employed. It should be cautiously used as it exerts a depressing effect upon the heart. In connection with the bowels it acts as a laxative, though only slightly so. It is prepared in the form of tincture, extract, and wine.

Cold. Deprivation or absence of heat. The extraction of heat from the human body by excessive or sudden cold is answerable for many illnesses, by impairing vitality and rendering persons susceptible to disease generally. Chill induces or contributes to pneumonia, catarrh, congestion, rheumatism, and many other maladies of a serious character, that is to say, the germs of disease are enabled to obtain a hold, because the powers of resistance of the organs attacked are reduced by exposure. So that the simple cold should be sedulously guarded against because of the ills it may bring in its train. Cold in the head is due to congestion of the mucous membrane, and springs frequently from standing or sitting in a draught. This and all other colds should be combated at their inception, to avoid complications. (See also *Catarrh*.)

Cold Baths are invigorating to the robust when not taken at a time of over-fatigue; the test being the occurrence of the "after glow" upon drying.

Cold Feet ought never to be warmed before a fire. The best corrective is momentary immersion in cold water, with vigorous chafing after drying on a rough towel. This should be continued until brisk circulation has been induced in the extremities. Never retire to bed with cold feet, or your rest will be disagreeably interfered with.

Cold, Keeping out. Good hot beef tea or beef extract of any reputable kind is the best thing for "keeping out the cold" during exposure to severe weather; next strong tea or coffee. Spirituous stimulants temporarily hasten the circulation and deaden the sensibility to chill, but the reaction is speedy and perilous when the exposure continues.

Cold, When overcome by. The patient becomes giddy, dazed, weak, and stiff in the joints, respiration feeble, pulse falling, intense drowsiness, culminating in coma. Vigorous friction should be employed to the whole surface of the body; but the sufferer should not be taken at once into a heated apartment or placed in front of a fire. A stimulating enema may be administered and attempts made to get warm milk, coffee, brandy, beef extract, or other stimulating or restorative drink into the stomach gradually.

Colic. A spasmodic and very painful affection of the bowels, more especially of the colon. There are various forms of colic—nervous, hysterical, bilious, hepatic, etc. Painters' colic is the result of the action of lead upon the system. A considerable accumulation of wind, neglected constipation, the action of powerful purgatives or poison, or exposure to cold, are all causes of colic. The paroxysmal pain is frequently relieved by pressure over the part, usually in the region of the navel. When flatulence is accountable for colic it is often capable of relief by hot water injections, or hot abdominal fomentations, with sprinklings of laudanum, may do good. An internal anodyne compounded of ginger essence, chloric ether, nupenthe, and tincture of cardamoms, is also recommended. Lead colic is an aggravated form of this malady denoted by a blue line where the gums meet the teeth and often by wrist paralysis.

Colocynth, or "**Bitter Apple**," or "**Bitter Gourd**," a species of cucumber obtained principally from the shores of the Mediterranean, and used with aloes or some soothing medium as a purgative.

Colonitis and Colitis. Inflammation of the colon, or largest division of the intestinal canal.

Coma. Is a state of insensibility resultant from some pernicious influence acting directly upon the brain. May arise from exposure to cold, apoplexy, epilepsy, inflammation of the brain, blood poisoning, opium taking, intoxication, or direct violence. The stupor of coma, with its accompanying insensibility, presents various symptoms peculiar to the exciting cause of the attack, symptoms which, to the skilled observer, suggest the course of treatment likely to be of avail. In coma, however induced, the doctor's aid should be obtained as speedily as possible.

Complexus. A muscle at the back of the neck, which in its action carries the head backwards on the atlas, and restores it to an erect position after having been bent forward.

Compound Fracture signifies a broken bone, accompanied by injury to the adjacent soft parts.

Concussion. Violent shock, usually understood in relation to a severe blow sustained on the head or spine. The immediate consequences of concussion of the brain are very alarming; but, unless the concussion injury be extensive they are generally of transient duration. There is collapse, vomiting, and loss of muscular control and power. Cold applications should be made to the head, and face, ammonia held to the nostrils, and stimulants administered. A strong purgative ought to be given unless recovery is speedy, and the bladder emptied; while warmth should be applied to the extremities, and mustard and hot water over the stomach. Meanwhile medical aid should have been summoned.

Condiments. Such as are in general table use are all, when moderately taken, of very great service as assistants to digestion and agreeable savours, but their excessive employment is a dangerous abuse.

Congestion. A deprivation of circulatory power, or an accumulation of blood therefrom resultant. Any collection of fluid matter becoming hardened is also in a congested condition. Congestion is synonymous with inflammation; and is denoted by local swelling, pain, and heat sensations. The temperature of the body generally needs reduction when extensive congestion is present anywhere, with local applications of a counteracting character, such as suitable poultices or fomentation, blistering, or, even in cases, cold treatment to the point of freezing.

Conjunctiva. A membrane in the front of the eyeball with the inner side of the eyelid covering the former and coating the latter. It is very susceptible to inflammation, which is termed conjunctivitis and may be conveyed by contagion or result from cold. Relief may be obtained by bathing in strong tea to which a few drops of laudanum have been added; while quinine can be taken internally as a tonic.

Constipation should be prevented rather than cured. It is an unnatural condition. Sedentary employment, especially when carried on continuously indoors is a sure provocation of costiveness; muscular exercise is essential to the proper performance of the intestinal functions. Therefore those who must sit for hours at a desk for a livelihood should make it a rule to have their morning and evening walks regularly, when constipation would trouble them but little. It is a potent evil. Retention of faecal matter in the bowels is certain to occasion absorption of contaminating fluid in the blood to a greater or less degree. Then will follow interference with the orderly action of the digestive and excretory organs and the increased susceptibility to infectious disease which comes with an unhealthy state.

Consumption. "Decline," or wasting away, is a disease of civilisation; and tuberculosis, its commonest form, a scourge particularly of densely populated, low-lying, and predominantly damp districts. Consumption, as we understand the term, is due to the presence and development within the bodily tissues of the person affected of the tubercle bacillus. It is not now considered to be a hereditary disease, that is, the germs are not transmitted from generation to generation. The masters of the healing art are making high endeavour to circumvent and stamp out the malignant micro-organisms whose ravages are held responsible for something like one-fifth of our death-rate. The open-air treatment cures many cases if taken in time. A long voyage in temperate seas may prove restorative should the disease have not secured too strong a hold; in either case the remedial migration ought to have the accompaniment of a nutritive dietary, generous and digestible. Food and medicine must be permitted conjoint upbuilding action. Constitutional strength should be sought through the absorption of such agents as cod-liver oil, hyperphosphate syrups, crocotes, and the calcium nitrate.

Contagion, or infection by "touch," as the term literally implies, has come to mean infection by immediate transmission in the case of zymotic disease generally. Thus, though there may be no direct contact of sufferer and visitor, the infection may be conveyed through the wearing of clothes that have been worn previously by one smitten with a disseminable ailment, by breathing air contaminated by his exhalations, or

by eating or drinking from vessels or handling utensils employed by him. "Catching" complaints include smallpox, scarlet fever, measles, mumps, whooping cough, influenza, typhoid fever, typhus, and consumption. All these and others are of an ascertained infectious character, and many virulent maladies besides those specified are strongly suspected of being contagious. For his own sake and that of the community at large, therefore, he behaves every person to exercise the greatest possible precaution in avoiding contagion.

Contraction. A shrinking or drawing together of parts, as from a wound.

Contusion is the technical term for an injury arising from bruising, and is generally succeeded by rapid swelling in the region of the blow. This arises from the rupture of minute blood vessels and the exudation of blood and lymph into adjacent tissue. Cold applications will check effusion and occasion slight closing at the orifices of the ruptured parts, thus expediting a resumption of the natural circulation. A compress of cloths frequently wrung out of the coolest obtainable water will usually be found helpful.

Convalescence is the period between the conclusion of the course of any disease and the complete restoration of the patient to health. Its duration depends of course upon the nature of the illness suffered, and frequently commences with a spell of very great prostration, the result of exhausting disease, which is gradually reduced as strength is regained. Generally a complete change of air is the best thing in convalescence, with a well-regulated and particularly nutritive dietary; while very great care is essential to avoid the inflammatory affections which the emaciated are so liable to incur. Cold must be guarded against, over-fatigue prevented, and much attention devoted to functional regularity.

Convulsions are involuntary muscular contractions, frequently accompanied by unconsciousness, and arising from some internal interference with the proper condition of the nervous system. Hysteria, epilepsy, lock-jaw and brain congestion occasion convulsive trouble in adults; in children they belong to the period of teething or are indicative of constipation or the presence of intestinal worms. When once convulsions have occurred in children, especially at the teething time, great care should be taken to keep the bowels in regular activity, and to maintain an equable bodily temperature by the use of comfortable clothing.

Cornea. The transparent membrane which forms the front of the eye-ball or pupil. It is the medium of the passage of light to the retina. Its opacity results in cataract, while variations in the convexity cause what is called long and short sight.

Coronary Arteries. Those nourishing the heart. **Corrosive Sublimate.** Bi-chloride of mercury, a very powerful antiseptic, administered in medicated form internally in certain diseases, but always requiring to be given with great caution and under medical oversight.

Coryza. A catarrh, especially that of the head, when attended with inflammation of the nostrils.

Coughing. The operation of removing the opaque portion of the lens of the eye in cataract.

Cough. A more or less violent effort at expectoration, expelling air and mucus from the air passages. It is more a symptom and indication of disease than an ailment itself, and is induced by the passages of cold air over an irritated part. When due to an affection of the larynx, a cough generally has a tickling kind of sensation at the top of the windpipe, and is spasmodic and accompanied by comparatively little expectoration. This is one of the sorts of dry cough, and is very irritating. But when the bronchial tubes or lungs are the seat of trouble, the cough ends in a discharge of mucus which may be purulent or sanguineous in character, according to the nature and extent of the disease present. Again, cough may arise from atonachic derangement, in children from the irritation set up by intestinal worms, or in females from uterine disorder. Always the cough is the outward and audible sign of some inward ailment of greater or less gravity, and whenever it becomes distressing, and its

nature is not understood, recourse should be had to medical skill.

Counter-irritation in medicine means the application superficially or some irritant with the object of relieving a deep-seated inflammatory condition.

Coup de soleil. The technical term for sun-stroke, heat-stroke, or heat apoplexy. The symptoms of this seizure are throbbing of the head, faintness, nausea, vomiting, and alarming interference with or failure of the heart's action. The best treatment to be resorted to, pending the arrival of medical assistance, is the cold douche, and the application of ice, if obtainable, to the head with wet packing to the body in severe cases. Large doses of antipyrin will, if necessary, be administered by the doctor (hypodermically, if the patient cannot be got to swallow, ammonia being injected). No alcoholic stimulant should be administered.

Cowpox is the disease with which human beings are inoculated under the vaccination system, to render the individual innocuous to any after-attack of the more virulent and loathsome human malady, small-pox.

Cramp is a spasmodic contraction of the muscles, generally attended with much pain; it arises frequently from prolonged or undue exposure to cold on land or in water, or it may be attributable to temporary exhaustion of physical power. When cramp in the bowels occurs it is usually owing to the presence of some indigestible food. It occurs in the limbs in cholera as the result of reflex irritation conveyed from the stomach or intestines. Over-lengthy immersion is a frequent cause of dangerous cramp, often fatal to bathers when assistance is not at hand. Friction is the best remedy for cramp, the brisk rubbing of the affected part.

Cranium. The skull, embracing the bones which enclose the head and brain, twenty-two in number. Cranio-malacia signifies softening of the bones of the skull.

Cream of Tartar. A popular laxative remedial agent, generally employed in conjunction with sulphur. It is also a useful diuretic in solution with water and lemon juice. Cream of Tartar is the bi-tartrate of potash.

Crepote. Resembles carbolic acid in odour and antiseptic properties. It is procured by the fractional distillation of coal tar. It has a sedative as well as antiseptic action on the skin, and so forms an invaluable ingredient of healing ointments. It will often allay toothache on application to decaying teeth, and makes a good pill for staying stomachic nausea.

Croton Oil. A violent purgative, obtained from the seeds of an Indian shrub. One drop will produce copious evacuation. It makes also a valuable counter-irritating liniment in bronchial and other inflammatory internal diseases. The liniment must be kept clear of the eyes, face, and any very tender part.

Croup (True). A dangerous inflammatory disease of the trachea, incident chiefly to children. It is of a spasmodic nature and aided, in its worst symptoms, to diphtheria. Croup, either, true or spurious, always gives rise to considerable alarm, especially if not relieved in the early stages. It is considered to be at first due to reflex irritation produced by constipation or indigestion in complication with cold. A good dose of castor oil administered with promptitude will not infrequently relieve the bowels and promote vomiting, the immediate result being the staying of the distressing spasm by the removal of its main cause. A dose of ipecacuanha wine will occasionally be useful in obtaining vomiting, and this expectoration also helps to expedite the flow of mucus in the windpipe and bronchial tubes. The chest of the child should be well rubbed with a compound liniment, back and front, of camphor, belladonna, and soap and opium, this being done every two or three hours until the symptoms exhibit marked abatement. Croup, taken in time, and submitted to this treatment, is generally overcome in a day or two; neglected, it may, in a very little while, develop into membranous or true croup, and get beyond the reach of medical skill, ending in the suffocation of the patient in a last prolonged spasm. The characteristic choking is one of the most distressing features of croup. "False" croup is a spasmodic affection, rarely of serious nature.

Cuticle. The external layer of the skin.

Cutting the Teeth. The removal of impeding tissue by absorption, usually called "cutting the teeth," commences in children at about six months old, the central incisors usually appearing first. The lateral incisors follow, from the seventh to the tenth month, and the canines from the fourteenth month onward, the first molars being "cut" concurrently. The second double teeth do not generally come into sight until the twentieth month, and may be delayed until the end of the third year. The back molars do not make their appearance with the first set, or baby teeth, but are cut at about six years old; and from then to seventeen years of age, or later, the renewal or change to permanent teeth is gradually taking place, final cutting being of the posterior molars or "wisdom teeth."

Cyanosis. Commonly called the "blue disease," in which the whole surface of the body becomes of a blue colour, through the venous blood circulating in the arteries. It is an incurable affection, due to congenital valvular malformation of the heart.

Cynanche. A genus of diseases, embracing affections of the throat attended with difficulty of breathing and swallowing, inclusive of quinsy, croup, clergyman's sore throat, &c.

Cyst. A bag, sack, or tunic, containing matter, which may be either semi-fluid or solid. The bladder is a natural cyst; morbid cysts are produced by disease. Frequently these are found under the scalp, containing a porridge-like substance, and are readily removable. Other cysts present at times in the body are usually amenable to operative treatment.

Dacryoma. A diseased condition of the lachrymal duct, in which the free flow of the watery humour of the eye to the nose is obstructed, occasioning the appearance of continual weeping.

Dactylitis. Inflammation of the fingers.

Damp Feet give rise to many ailments, checking healthful perspiration and causing inequality of blood circulation. Dry stockings and shoes should immediately be put on after there has been exposure to wet, whereupon injury to the health will usually be obviated. The chief peril lies in keeping damp covering over the feet when moving about ceases.

Dandelion, the taraxacum of pharmacy, is a common medicine of very considerable efficacy in ailments of the kidneys and the liver, either as a decoction of the root or taken in pill form.

Dandruff. A scurfy affection of the scalp, consisting in exfoliation of the scales of the outer skin, of frequent occurrence in infants and young children. It is inadvisable to use hard brushes and small tooth combs when dandruff is troublesome; frequent washing with borax solution is very beneficial.

Deadly Nightshade. The *Atropa belladonna*, a very powerful narcotic, having a toxic effect upon the involuntary muscular system, much employed in the treatment of disorders of the eye; also in constipation and bladder troubles.

Deafness may be temporary or permanent, complete or partial, curable or incurable. When resultant from catarrh or obstruction of the aural passages, it may frequently be relieved by syringing with lukewarm water or antiseptic fluid, but should success not result from careful treatment, competent medical examination ought to be secured. See *Ear*.

Death. Tests of. Hold hand-mirror over mouth, if life remains moisture will gather on the glass. Push a needle gently into the flesh, the puncture will close in a living body, and remain open in case of death having already occurred. The fingers, held in front of a powerful light, look dark almost to blackness after death, but of reddish hue so long as there is life in them.

Debility. Weakness and relaxation of the muscular fibres and general depreciation of vitality, resultant from continuous illness or exhaustive activity, mental as well as physical. Healthy regularity is the best preventive of debility.

Decoction. A product obtained by steeping or boiling in water any substance employed medically.

Delirium. A condition in which the sufferer has confused ideas of the past and present circumstances.

It is a frequent accompaniment of fever or disease of any exhausting description, and may be due to some inflammatory or other ailment of the brain; or it may result from excessive use of alcohol. The inducement of sleep and repose ought to be aimed at as an important remedial measure.

Deltoid.—The large muscle on top of the arm or shoulder.

Demulcent.—Mollifying, softening; a term applied to medicines such as marsh-mallow, mucilage, etc.

Dangue.—A form of malarial fever or epidemic rheumatism, sometimes styled "Dandy fever." It is liable to recurrence, and is most frequent in hot, damp countries, being characterised by painful swelling of the joints accompanied by eruption. Epidemic influenza has considerable affinity to the dengue of the India.

Depilatory.—Having the power to remove hair temporarily. A term applied to lime and other substances employed for the purpose.

Depression.—Lowness of spirits, a condition generally due to debility or interference with the nervous or bodily health, indicating the necessity of tonic treatment.

Dermia.—The true skin, hence dermatic, pertaining to the skin, and dermatoid, resembling the skin, and dermatitis, an inflammatory condition of the skin.

Desquamation.—A separation or falling off of the skin in small scales, a process which frequently occurs after diseases which have occasioned acute inflammation of the surface of the body, such as fever, measles, erysipelas, etc. In such cases the discarded scales are often charged with the germs of the malady which occasioned their removal, and should be regarded as highly dangerous.

Diabetes.—An excessive and morbid discharge of urine, with other distressing symptoms, are present in this painful malady; and the discharges may either be insipid or abundantly impregnated with sugary matter. Diabetes is a condition calling for medical assistance of a skilful character, as the dietary always requires very careful regulation. Abstinence from all foods containing sugar or starchy substances is usually enjoined, and the medicines chiefly employed are opium, morphia, and salicylate of soda. The disease is less fatal to people well on in life than those of younger years.

Diachylon Plaster is employed in strips for drawing the raw surfaces of wounds together, or for exerting pressure upon boils and ulcers in order to facilitate healing.

Diagnosis. The art and act of distinguishing diseases by their symptoms, and so determining the necessary remedial treatment.

Diaphoresis, Sweating, hence diaphoretic, that which will produce perspiration, and diaphoretics, sweat-promoting medicines. These are employed in fever, to excite the sweat glands of the skin to action, phenacetin being one of the most potent and safe. Antipyrin is also a good deal used, but requires very cautious administration. Milder diaphoretics are ipecacuanha, acetate of ammonia, opium, and antimony, and diaphoresis may be induced by hot baths, vapour or water.

Diaphragm, or Midriff, the thin muscular partition between the chest and abdomen, attached to the spine, the lower ribs and the sternum, or breast bone. Its contraction and expansion are the principal agents in the action of respiration; and it is traversed by the œsophagus, or food-pipe, the great aorta, and other important tubes. Diaphragmatitis signifies inflammation of the diaphragm or its peritoneal coats.

Diarrhoea is usually due to the presence of irritating matter in the intestinal canal, and is commoner in hot weather than at other periods. Its proper treatment is the clearance of the canal by means of castor oil and laudanum, or some other effective aperient, such as a mixture of rhubarb, ginger, and soda. In infantile diarrhoea chalk mixture is usually administered after each loose purgation, but the removal of the cause is of much more moment than the stopping of the flow in most cases.

Diet should be varied within healthful limits, but always in accordance with the principles of supplying nutrition of a proper character in sufficiency, if

should be wholesome, simple, and be partaken of temperately and with regularity—due regard being given to the requirements and condition of the individual. Prudence in dietary will have its reward, recklessness its revenge.

Digestion implies the conversion of food into chyme and chyle, and the consequent formation of blood and nutrition of the body. The food, on its reception in the stomach is subjected to muscular movement and the action of gastric juices, in due course being changed into the butter-milk-like chyme. Passing in this condition into the first part of the intestinal canal, two new liquids are poured upon it, the bile from the liver, and from the pancreas the pancreatic juice. It is now converted into chyle, which resembles milk in appearance, and passes along the thoracic duct to the upper part of the chest, whence it reaches the right side of the heart, and is then forced into the lungs for aëration. The oxygenation of the chyle supplies the needed nutrition of the entire system. The initial stage of digestion is accomplished in mastication, which it is highly important should be thorough, in order that the salivary secretions may be properly mixed with the food. Saliva converts the starch we eat into sugar. When the lacteal vessels have done their duty, the unassimilated portions of food pass into the colon or large intestine, where they become acidulated and amalgamated with feculent excretions, and must in due regular course be evacuated, or the blood will thereby receive contamination, with certain prejudicial effects upon the nervous system. In perfectly healthy functional conditions all these processes go on uninterruptedly; the failure of any part of them spells indigestion, derangement, disease, and pain. (See **Indigestion.**)

Digitalis. The common Foxglove furnishes a powerful tonic, acting upon the heart in a wonderful way, stimulating circulation throughout the body, and having a particular effect upon the secretory functions of the kidneys. The drug should never be administered except under the doctor's immediate direction; it is far too potent to come within the category of domestic medicines, valuable as are its properties when skilfully applied.

Dilatation. The process of enlargement or expansion, as of the chest in respiration or the heart in effecting the circulation of the blood.

Dill. Asplant not unlike the fennel, from which is prepared the dill-water so frequently administered with beneficial effect to infants suffering from pain induced by flatulency.

Diphtheria is a dreadful disease, due generally to insidious conditions. It is caused by a distinct germ conveyed in drinking water, food, or by the saliva, from a vitiated atmosphere. Lassitude and weak pulsation are amongst the first indications of an attack. Small yellowish ulcers appear upon the tonsils, spreading rapidly over the throat, larynx, and pharynx if not arrested by anti-epietic treatment. Carbolic acid or some other suitable germicide should be called into requisition and frequent and persistent gargling performed; whilst every endeavour must be made to improve the general health by the employment of tonics and nutritious and stimulative dietary.

Dysomania is a form of insanity in which the will-power to resist alcohol is impaired, with most distressing consequences to its subject and his or her connections. It requires the most patient specialistic treatment, and frequently proves incurable, bringing misery in its train, and ending in a dreadful death.

Disinfectant. An agent which attacks putrescent or miasmatic substances or matter, and transforms them into harmless products either by uniting with them or breaking them up. The chief natural disinfectants are sunshine and fresh air, soil or fresh earth, water, heat, frost and light; while the principal artificial or prepared disinfectants are charcoal, coaltar, and its products, carbolic acid, quick-lime, nitrous acid, chlorine, ozone, permanganate of potash, sulphate of lime, sulphurous acid, and fresh-roasted and ground coffee. A supply of disinfectants should be ready to hand for use in emergency in every well-regulated household.

Dislocation, as generally understood, means the displacement of bones by accident or direct violence. Their reduction, or replacement, usually requires the exercise of surgical skill; but in most cases the mischief may be remedied by prompt lay assistance. One of the most frequent dislocations is that of the shoulder-joint, and this is also one of the most readily reducible. The injured person should be placed upon a chair, with another by his side. Then let the operator plant his foot firmly upon this second chair, introducing his knee under the armpit of the sufferer, raising the arm and pulling strongly outwards and downwards over the knee-fulcrum, the patient's elbow being the lever employed to get the joint into its old position. Let all be done with confident deliberation. Wrist, elbow, ankle, knee and thigh dislocations are usually reduced by drawing the limb powerfully forward in its long axis, and when the fullest possible extension has been obtained, exerting lateral pressure to force the displaced bone into the socket. Repose is requisite after the reduction of dislocations to enable the tissues which have undergone violent strain to receive natural consolidation; and, after injury of this character has been sustained, no time should be lost in seeking the remedy, for dislocations are always harder to set right by the lapse of time.

Dispersions. The removal of inflammation from any part of the body.

Diuretics are those medicines which increase the urinary flow by acting upon the secreting power of the kidneys. Digitalis, broom, dandelion, squills, salts of potash, and various malt liquors are amongst the agents medicinally employed in this direction; whilst the copious administration of all kinds of fluids is resorted to when it is desirable to dilute the urine and flush the kidneys because of the irritating nature of the discharges in various diseases.

Dorsal. Pertaining to the back. *Tabes dorsalis* is the scientific denomination of wasting of the spinal marrow.

Dover's Powder. A drug compounded of opium, sulphate of potash, and ipecacuanha. Useful alone or associated with other medicines in the treatment of numerous ailments, and obtainable at any pharmacy.

Dracughts are always dangerous, especially when they convey moisture into contact with the person, and should be sedulously avoided.

Dressing is an important appanage of surgery, and the remedial treatment of wounds and injuries generally. The object chiefly aimed at is the procuration of rapid healing by the decomposition of fluid exudations. Wounds are therefore dusted with some suitable antiseptic powder after careful cleansing, and then neatly bound with blue gauze, or some other medicated textile, at times impregnated with an anæsthetic such as cocaine, according to the requirement.

Drink. The proper guidance to drink is to drink only when one is thirsty. To drink just before or even during a meal is not good. A sip or two of suitable fluid during any meal is natural, the "long drink" should be delayed until the close. Less liquid is really necessary for the maintenance of health in winter than in summer.

Dropsy is a morbid collection of water in any part of the body, when the natural cavities become distended with that fluid. Dropsy of the abdomen is called *ascites*, dropsy in the chest *hydrothorax*, in the scrotum *hydrocele*, in the head *hydrocephalus*, dropsy generally *anasarca*. These various forms of the malady will be found dealt with under their specific denominations.

Drop Wrist, due to paralysis of the muscles which extend the hand, is a characteristic of lead-poisoning. Massage and the application of electricity locally are resorted to for the removal of this alarming condition, concurrently with the endeavour to get the poisonous cause of the trouble out of the system. Should there be accompanying constipation, as is usually the case, prompt measures should be taken to get rid of it.

Drowning. In cases of apparent death by drowning, resuscitation may often be effected by

assiduous attention after the recovery of the body from the water, and should always be attempted unless it is absolutely certain that hope is past; hours of persistent effort have often been rewarded by success in seemingly desperate cases. The Schafer method of resuscitation is now generally employed and is recommended by the Royal Life Saving Society, by whom the following instructions are issued: After a person has been lifted out of the water, and no sign of life can be observed, immediately turn him face downwards. Kneel on the side of the patient and place your hands flat in the small of his back with thumbs nearly touching and the fingers spread out on each side of the body over the lowest ribs. Then promote artificial breathing by leaning forward over the patient and, without violence, produce a firm, steady, downward pressure. Next release all pressure by swinging your body backward without lifting your hands from the patient. Repeat this pressure and relaxation of pressure without any marked pause between the movements, about fifteen times a minute until natural breathing is established, after which turn the patient face upward and proceed to promote circulation and warmth. Then rub the limbs upwards, with firm pressure, using handkerchiefs, flannels, &c. Dry the hands and feet, and as soon as dry clothing can be procured strip the patient and re-clothe or cover with blankets, &c. Continue friction over dry clothing or under the blanket. After respiration has been restored carry the patient to a house. Continue to promote warmth by the application of hot flannels to the pit of the stomach, and bottles of hot water, heated bricks, &c., to the armpits, thighs, and to soles of the feet. If the power of swallowing has returned, small quantities of warm water, warm brandy and water, or coffee may occasionally be administered; the patient kept in bed and sleep encouraged. In all cases send for a medical man as soon as possible.

Drum of the Ear. The tympanum or membrane separating the external from the internal ear, and receiving from without sound impressions for their conveyance by the ossicles or internal bones to the auditory nerve and eventually to the brain.

Duct. A canal or tube of small size, conveying fluids in the body from a secreting organ. Thus the lacrymal duct, for the conduct of tears; the gall duct, carrying the bile to the bowel; the salivary duct, conveying the saliva from the glands to the mouth, &c.

Duodenum. The first portion of the intestine, commencing at the pylorus, by which it communicates with the stomach, and terminating at the jejunum. Into the duodenum—so called from being usually about twelve inches in length—comes the chyle from the stomach to be mixed with the biliary and pancreatic secretions in the digestive process.

Dura Mater. The exterior of the three membranes enveloping the brain, the others being the pia mater and the arachnoid membrane. The dura mater is otherwise named the *dermatoid membrane*.

Dysentery. A disease in which there is a great difficulty in passing the feces, which consist chiefly of mucus and blood. It is usually accompanied by fever, and followed by useless straining for evacuation. The seat of the mischief is mainly in the large intestine and the mucous membrane, both of which become greatly inflamed. It commences with shivering and feverishness alternately and diarrhoea. Unless relief is obtainable, collapse usually occurs in a short period; and when recovery has been effected there is always danger of relapse upon dietary indiscretion or exposure to damp and cold. Ipecacuanha is the great remedy for dysentery in the East, and this and opiates after aperient treatment with castor oil and laudanum often prove useful in overcoming the disease.

Dysmenia. Difficult or painful menstruation. (Called also *Dysmenorrhœa*.)

Dyspepsia. This is a form of indigestion, which, if neglected, will reduce a person to a miserable condition. It usually arises from indiscretions of diet, with neglect of proper exercise, or from habitual neglect of the "calls of Nature." Proper mastication is antagonistic to the dyspeptic condition, and where this important preliminary of digestion is rendered

imperfect by bad teeth, dental attention is very urgently necessary. Those whose digestive organs are not vigorous will be well advised to abstain from fermenting foods such as oatmeal, soups, stews, and boiled meats; and they should attend very carefully to the condition of their bowels. Other foods for dyspeptic subjects to abjure are shell-fish, pastry, salt foods, pickles, pork, potatoes, uncooked vegetables, and strong tea that has stood long in the pot. Pepsin is a useful medicament for sufferers from this malady, so is bismuth and soda. But above all take plenty of time over the meals, and eat regularly and never to excess, with nothing at all solid or heavy after the mid-day repast.

Dysphagia. Difficulty in swallowing, which may arise either from constriction of the gullet or oesophagus, or from nervousness.

Dyspnoea. Shortness or difficulty of breathing, associated with syncope, and disease of the heart, lungs, larynx, or windpipe. Frequently a consequence of indigestion and a distended state of the intestines or stomach.

Ear. This complicated organ is divided into three parts, commonly called the external, the middle, and the internal ear. The external ear, or auricle, and the auditory canal which leads to the drum-head or sound-receiver, the drum-head itself, and certain portions of the tympanum or drum cavity, are visible or accessible from without; the internal ear, consisting of many minute sub-divisions, including the delicate nerve of hearing, is deeply hidden in the petrous bone, the hardest bone in the human frame. It is essential that the internal ear should be free to constant communication with the atmosphere, to obviate undue pressure from the membranous drum. This communication is carried on through the Eustachian tube, which runs in the mouth just behind the tonsils. Should this tube become congested, as it does during catarrhal affection of the mucous membrane of the throat and nose, deafness results from rarefaction of the air within the internal ear, a condition usually styled throat deafness. Hearing also may become impaired by undue secretion and partial congelation of wax in the external ear, which can generally be set right by the employment of the aural syringe. Should this fail to afford relief, the application of mustard plasters behind the ear will frequently produce a good effect. Small abscesses occasionally form in the outer aural passages, giving rise to earache and disagreeable noises in the ear, but these usually soon break and discharge, leaving no mischief behind. Abscesses in the inner ear are dangerous, because of their proximity to the brain, and call for skilled attention. Inflammatory aural ailments may be treated by poulticing and fomentation with injections of laudanum; but always under medical advice.

Echymosis. Extravasation of blood, as in the cases of bruising blows; the "black eye" is the most conspicuous kind of echymosis. The impact of contusion ruptures small blood vessels under the skin, their contents escape into adjacent cells, swelling and discoloration ensue until Nature has righted things. Prompt application of cold substances will generally expedite matters.

Eczema. Heat eruption, occurring in small confluent vesicles. It arises from an ailment of the outer skin, hindering its proper development during the renewals which should always be in progress, and permitting the exudation of watery constituents of the blood. Eczema may be present in any part of the skin, but is most frequent at the flexure of the joints, behind the ears, and on hands, arms, and legs. A favourite remedial application externally is the oxide of zinc, which may be dusted over an olive oil dressing. The only soaps employed for cleansing purposes in any kind of eczema should be those free from all irritating detergent properties and properly impregnated with either carbolic acid or juniper tar. Dietary is of great importance in this disease. Salt meats, acids, fruits, pastry, and soups should be avoided, and malt and spirituous liquors.

Effusion.—May signify the natural secretion of the fluids of the body, as it also denotes their escape from

the natural position as a result of inflammation. In pleuritic effusion there is interference with lung action through the undue accumulation of fluid in the pleural cavity; effusion into the cavity of the skull gives the hydrocephalic or "water in the head" condition, inflammation of the peritoneum or abdominal lining membrane, and may bring about dropsy; effusion into the pericardium, resultant on inflammatory action there, may dangerously affect the heart; hydrocele is effusion into the scrotum; other abnormal effusions into tissues and joints are associated with various diseases, and directly consequential thereto.

Electuary. A medicated conserve.

Elephantiasis. An abnormal enlargement or expansion of the legs and feet or other parts of the body, arising from a preternaturally thickened condition of the skin and the tissues beneath it. Operative treatment is necessary for the removal of this unhealthy condition, which at times assumes gigantic proportions.

Emaciation. A gradual wasting of flesh and fat, indicative of disease. Emaciation occurs in many exhausting diseases which terminate fatally, and sometimes also in ailments of a much simpler and less dangerous character, as in dyspepsia, when the proper assimilation of food is suspended. In malignant disease of the liver and in pneumonia emaciation is a constant symptom. Restoration of the glandular system is essential to the removal of emaciation, and this must be sought through medicament suited to the case, in combination with judicious dietetic measures. The chloride of calcium is a very valuable remedial agent in curable emaciation.

Embrocation. An external stimulating or soothing application, called also a liniment.

Emetics. Should be administered intelligently, as with all things regard to the treatment, never in a speculative way. Their object is to induce vomiting and thus quickly relieve the stomach or digestive system of undesirable contents. Emetics may be introduced to the stomach directly, or administered by injection. Amorphine, for instance, is always given subcutaneously, and ejection of the contents of the stomach is immediately consequent. Great care should be exercised in the use of emetics in the case of particularly stout persons, or where there is pregnancy or rupture; and it should always be remembered that antimonial wine, a potent emetic, is a depressant of the heart's action; the dose of it is one or two drachms at most in water for a strong adult, followed by copious draughts of warm fluid. Safe emetics are ipecacuanha wine (half ounce to one ounce) mustard and water, or sulphate of zinc (20 grains in water); all to be followed by plenty of tepid water. Any of these may be administered with advantage in spasmodic affections, such as croup, asthma, colic etc., and, in carefully regulated strength, to children where there is a great accumulation of mucus in the chest. The stomach pump is better than any emetic for effectually and completely emptying the organ.

Emulsion. A medicine of a milk-like character, prepared by the amalgamation of some alkali or sugar with oil and water. This new milk furnishes a natural emulsion, uniting in its composition cream and milk. An admixture of the yolk of egg or gelatin with soap, milk, gruel or water will afford an emulsion for medical purposes; and powdered sweet almonds in water are frequently employed as a vehicle for medicines which tend to precipitate in simple fluids.

Encephalitis. Inflammation of the brain.

Endemic Diseases. Those arising from local conditions, as ague, in swamps and fenny neighbourhoods, or belonging to a particular period of the year.

Enema. An injection into the bowel, employed often with beneficent effect in constipation. Salt and water, or soap and water, are commonly used in this manner for the relief of a loaded lower bowel when its condition has given rise to pain and trouble; and the enema is very valuable in dysentery, diarrhoea, and where worms are working intestine mischief. Anti-sepsis as well as anodyne ingredients can readily be combined in an enema, which may be administered by various forms of syringe obtainable at the pharmacies.

Enteralgia. Nervous pain in the bowels, commonly called stomach-ache.

Enteritis is typhoid, or gastric fever, due to the absorption in the alimentary canal of specific disease germs. Its presence is generally attributable to defective sanitary conditions, and the use of unwholesome drinking water is perhaps the most prolific incentive to enteritis. The great dangers of this condition are hemorrhage and blood-poisoning. The characteristic initiatory symptoms of enteritis are great bodily prostration, copious diarrhoea of a peculiar peasy appearance, high pulse, and furred tongue. Purplish eruptive spots are seen on the abdomen and sometimes on the chest; the temperature rises at night and goes down towards morning. Deficient secretion, except in the bowels, follows, and disturbance of the urinary system occasions uræmic poisoning and coma in the concluding stage. To prevent the partial functional paralysis which brings about this grave condition, the medical treatment aims at controlling the exhaustive diarrhoea and keeping down the temperature of the patient as much as possible. Phenacetin is employed as an antipyretic, and if by its aid perspiration can be induced, and restlessness gives place to refreshing sleep, the case at once becomes hopeful. Skillful and unremitting nursing attention is quite as important in enteritis as medical treatment. No solid food must be given till the patient has completely recovered.

Enteritis. Inflammation of the external coat of the intestines, due generally to catarrh, and indicated by excessive discharges of mucus. Dysentery is one form of inflammation of the bowels, affecting, as it does, part of the colon; but the catarrhal inflammation may affect the whole of the mucous membrane of the alimentary canal to a distressing extent. Small doses of arsenic, administered in tar, will often be found remedial in enteritis, after eating; and the dietary must be most carefully regulated, nothing difficult of digestion being permitted.

Entozoa. Several species of troublesome parasitic worms or low animal organisms, chiefly such as infect the intestines, and exert an irritating influence. (See *Worms*.)

Epidermis. The outer or scarf skin, not composed of fibres, but of separate rounded cells. These are piled upon each other in layers to a variant extent, the cuticle in places, such as the soles of the feet, attaining considerable thickness; in other parts, as on the face, being smooth and thin. The epidermis is always, however, formed in two layers, the outer flat and resistant to injury; the inner soft and tender, and developing to take its place in due course externally. From the inner the outer skin of the epidermis is renewed when there has been blistering, scalding, eczema, or scaling after eruptive disorders.

Epigastric Region. The upper part of the abdomen.

Epiglottis. A cartilage of the larynx, which protects the glottis, or wind-pipe, when food is being partaken of. It is a heart-shaped gland of gristle, and participates in the movements of the tongue.

Epilepsy. A kind of fit, consisting in the concurrent loss of consciousness with convulsive movements of the limbs of a more or less violent character. Generally the sufferer subsides to the ground with lividity and distortion of countenance, staring and fixed eyes, frothing mouth, laboured or seemingly suspended breathing, and tumultuous beating of the heart. The tongue protrudes, and is sometimes badly bitten by the teeth during convulsive action of the jaws, while there may also be involuntary evacuation. The full fit, even in a bad case, seldom continues longer than a few minutes, and is succeeded by drowsiness and a dull, stupid appearance, with troubled sleep of considerable duration, during which the fit may or may not recur. A great many fits may occur, and that daily in persons subject to epilepsy or "falling sickness," as the malady is sometimes called, and the seizures may take place without warning at all, or follow presymptomatic ones. One of these is a peculiar sensation known as "epileptic aura." This is an indescribable feeling, as of a vapour, originating in the extremities and passing up toward the head. Epileptic fits may be distinguished from

those consequent at times upon hysteria by the absence of laughing or crying, and from apoplexy by the dilated condition of the pupils and the loss of the peculiar smothering and paralysis which usually are the accompaniment of an apoplectic seizure being wanting. Epilepsy is sometimes "shammed," but the impostor is careful to avoid hurt in falling. Constipation, digestive derangement generally, intemperance, teething, worms, excessive passion, menstrual irregularity, great mental worry, and other exciting causes may bring on epilepsy, which is liable to continue during convulsional disturbance, but is rarely fatal, save from injury sustained in the fall or from suffocation arising from constriction of the muscles of the throat and chest during the convulsive paroxysms. The treatment of a preventative character consists in improving the general health and removing as far as possible all contributory causality. During the seizure protect the sufferer from self-injury, loosen the attire round the neck and waist, lift on to a couch or bed, raising the head and shoulders, and sprinkle the face with cold water. Do not disturb the sleep which succeeds the fit, or mental mischief may ensue. A piece of wood may be placed between the teeth whilst the convulsive movement of the jaws continues, to prevent the biting of the tongue, and artificial teeth should be removed; while the careful administration of chloroform, it should be remembered, will often cut short an epileptic attack. An epileptic must not be left alone after a fit in case another attack comes on. Those subject thereto ought to be most attentive to their dietary, and sedulously shun excitement.

Epiphysis. One part of bone growing into another, from which it had previously been separated by cartilage.

Epistaxis. Bleeding from the lining membrane of the nostrils which secrete the nasal mucus. It can often be stayed by the application of cold to the spine, or by holding the hands above the head. In persistent hæmorrhage of this character the nostril may be plugged with cotton-wool saturated in some stringent solution or dipped in powdered alum. Those liable to frequent epistaxis may advantageously take iron or some other blood tonic.

Epuila. A swelling of the gums.

Erethication. Erection of wind from the stomach through the mouth. It arises from indigestion and the consequent escape of gas generated in the stomach. Charcoal powder is recommended as a palliative, but the obvious preventative is attention to the digestion.

Eruption. Excretion producing small pustules on the skin, as in scarlatina, measles, small-pox, etc., and indicating a diseased condition of the blood or a vitiated state of the cuticle.

Erysipelas. An inflammatory affection of the skin, attended with the formation of vesicles and by feverishness. Sometimes this painful ailment, which is known also as "St. Anthony's fire," and as "Rose," extends to sub-cutaneous tissue, and assumes serious dimensions, giving rise to delirium and even coma. It is due to the presence of a specific disease germ, which may be transmitted. Erysipelas occurs occasionally with no apparent outward cause, or it develops in a wound or from an injury in which the germ has found lodgment and proceeded to produce its progeny. It is always accompanied with considerable pain and hardness of the affected part. There is a tingling and burning sensation under a shiny red surface with swelling which pits and whitens on pressure. Meanwhile there is a generally febrile condition of the body, following shivering attacks. Then the inflamed patches subside, to reappear on some other portion of the body, not necessarily adjacent; the parts first affected scabbing and scaling, or forming large blisters charged with yellowish fluid. In bad cases the swellings suppurate extensively or form abscesses, and may occasionally gangrene. If erysipelas should make its appearance in the face without being resultant upon injury, there is always peril of its spreading to the covering membrane of the brain, with fatal effect. Glycerine and a solution of ichthyol are applied to the sores with frequent success. This is a much better practice than the old plan of dusting over the inflamed surface with flour, even upon a dressing of carbolic oil. Tincture of the murate of iron may

also be administered advantageously, and saline purgatives are good, while the diet should be light and nutritious. The tendency of the sores to wander over the body may sometimes be checked by painting with undiluted tincture of perchloride of iron.

Erythema. A morbid redness of the skin, and superficial congestion somewhat resembling erysipelas, though unattended by the dangerous symptoms of that malady, usually attendant upon gastric disorder. Its severity is sometimes sufficient to occasion the formation of vesicles. Medical treatment should embrace the endeavour to amend disordered digestion and to keep the bowels in regular order. Erythema nodosum is a form of this disease to which rheumatic and syphilitic persons are occasionally subject. The swellings appear upon the forehead or over the bones of the shins, and require blistering, with the administration of iodide of potassium.

Ethers. A product of the distillation of alcohols with acids, as nitric, sulphuric and other ethers.

Eucalyptus. The Blue Gum Tree of Australia, yielding an oil of very valuable antiseptic virtue. The tree itself is wonderfully destructive of the miasm of ague; and the essence of its foliage is largely employed for inhalation in influenza, catarrh, diphtheria and other ailments of the air passages.

Eucalyptin. A resinous preparation of considerable service in bilious disorders, usually administered in combination with sassa extract.

Eustachian Tube. The normal communication between the ear-drum and the throat, permitting the passage of air into the tympanum. It opens into the upper and back part of the throat, in the region of the pharynx, just above the floor of the nostrils. The access of catarrh into this important tube, partially or completely closing the channel, causes the condition called "throat deafness."

Exacerbation. Increase in the severity of a disease.

Exalgia. A substance produced by the decomposition of coal-tar, and sometimes recommended as an anodyne in neuralgic affections.

Exercise. Signifies the employment of the voluntary muscles. The circulation of the blood and the formation of its elements within the body, as well as their destruction when done with, are all powerfully and favourably influenced by this exercise; so that it is obvious that without it there will be a sacrifice of health. A systematic and well-regulated diurnal course of out-door exercise should be undertaken, of an agreeable and not over-fatiguing nature and extent; and of all exercises walking is the best; though this may be advantageously varied by participation in some interesting pastime. Riding is good, so are cycling, tennis, cricket, croquet, golf, skipping, fishing, shooting, and many other sports and games.

Exhalation, or the emission of vapour, occurs in the human body, from the lungs and the pores of the skin. Disorders of the kidneys and the cuticle interfere with this process, to the discomfiture of the individual in the degree of their magnitude.

Exhaustion. Exhausts the over-prolonged expenditure of energy, muscular, nervous or mental; but "training" or gradual habituation to endurance, will enable individuals to withstand fatigue to a surprising extent.

Exomphalus. A rupture of the navel.

Expectorants. Medicines which assist the discharge of phlegm or mucus from the mouth. Amongst the most frequently employed expectorants of the removal of surplus secretions of the mucous membrane are ammonia, antimony, paregoric, terebene, and ipecacuanha.

Expectoration. Provides, in the sputa, a valuable guide very often to the internal condition. Thus, if the mucus or matter expectorated be frothy in character, bronchitis or catarrh of the air passages may be indicated. Should the sputa be viscid and rusty-coloured, pneumonia or lung inflammation may be suspected. If it be purulent consolidated, and blood-tinged, consumptive disease of the lung-structure is pointed to. The patient is "spitting his lung away." Thus the trained eye can divine from what is cast out of the system what is going on within. In suspected

consumption the expectoration is examined by the microscope to detect the germs of the disease.

Extravasation. Escape of the fluids of the body from their natural canals, and consequent diffusion in adjacent tissue. Most bruises produce extravasation.

Eye. The organ of vision, a most beautiful piece of natural mechanism, perfect in every particular. The eye may be conveniently considered in two divisions, the globe or eyeball, and the appendages which control its functions. It is placed in a bony case, which protects it as effectually as possible from internal injury, the socket in which it revolves, and moves so easily. It is further guarded from harm by the eyelids, which automatically close at the approach of danger. The membranous external covering of the eyeball is reflected upon the lid, and is called the conjunctiva or white of the eye. In the centre of the globe is the pupil-opening, closed by the iris muscle; the pupil and its contiguous coloured substance together constitute the cornea. The entire eyeball of an adult is barely an inch in diameter, and measures rather more from back to front. It is enveloped by the sclerotic, a firm membranous structure, which at the posterior surface opens to admit the optic nerve. Within the sclerotic membrane is the darkish brown choroid coat, and within this again the retina, an expansion of the optic nerve forming the sensitive substance upon which are projected objects whose impressions are conveyed to the brain. The globe of the eye is filled with two transparent fluids, contained in chambers, between which is situated the lens. The anterior chamber is charged with aqueous humour, the posterior with vitreous humour. Rays of light emanating from the objects presented to the vision pass first through the cornea, next through the aqueous humour, the lens, and the vitreous humour in turn. In their passage the rays undergo refraction, which bring them into their proper focus on the retina. The choroid coat absorbs all the superfluous rays, which would otherwise confuse the vision. The eye is subject to many diseases. Ophthalmia, or conjunctivitis, is an inflammatory condition of the external part, and produces a red discoloration. Scleritis, usually of rheumatic origin, presents a more vivid appearance. Inflammation contracted in the cornea may induce opacity interfering with the transmission of rays of light. The lens may be affected and become opaque, when cataract is the resultant. The retina, the humours of the eye, and the choroid coat, are all also liable to ailments of a more or less serious nature; and every affection of any part of the visual system requires the most skilled and specialistic remedial treatment.

Eyebrows are formed of muscle and thick skin, covered with stiff hairs, and resting upon a bony ridge above the edge of the orbit. They are drawn down instantly when dangerously dazzling light is encountered by the eye, and they intercept and shed the perspiration trickling down the forehead. Perfect eyebrows are found in no animals other than mankind.

Eyes, Test or Grip In. Roll up a piece of soft white blotting-paper like a pipe-stem, and moisten the end to remove the irritating foreign body, meanwhile rubbing the other eye.

Fainting. Fainting, or swooning, may occur from shock or from loss of blood, or other depressing cause, mental or bodily, such as affection of the heart or excessive diarrhoea. The patient becomes pale and loses consciousness. The eyes dilate, the skin is clammy, the limbs are loose, the muscles relaxed, the sufferer falls to the ground as one dead. Remove the sufferer, in the lying-down position, to the open air or a well-ventilated apartment, letting the head rest lower than the body. Loosen the clothing, sprinkle the face with cold water, apply strong smelling salts to the nostrils. Should the patient be capable of swallowing a little sal volatile, or brandy and water, it may be administered. If nitrate of amyl be procurable, the inhalation from a handkerchief sprinkled with a few drops will often have powerful restorative effect. Chaffing the hands and friction to the limbs generally is helpful, and it may be necessary to apply a mustard poultice over the region of the heart.

False Ribs. The five lowermost ribs, so styled

because the 11th and 12th pairs are loose at one end, and the cartilages of the rest run into that of the 7th ribs, instead of being prolonged separately to the breast bone, as in the case of the upper seven or true ribs.

Fauces. The cavity between the mouth and throat, bounded by the tongue, tonsils, uvula, and the larynx, leading to the pharynx.

Febriacula. Slight feverish attacks, principally affecting children, arising from disordered digestion, and readily corrected by removing the cause.

Febrifuge. That which dispels or mitigates fever. An old medical term not so much used nowadays as formerly. Quinine used to be the most frequently employed of all febrifuges, and it is still in vogue as such, though phenacetin, antipyrin, and other potent drugs have supplanted it in modern medical practice to a very considerable extent.

Femur. The Os Femoris, or thigh bone, extending between the haunch and knee. It is the longest bone in the body, and is frequently the subject of fracture, which requires most skilful attention for reduction. The placing of the broken parts in apposition and their retention until proper re-union has taken place often presents considerable difficulty.

Fever. A disease characterised by heightened bodily temperature, increased and rapid respiration and pulsation, thirst, loss of strength and general functional disturbance. It may arise from chill, blood poisoning or direct infection; but the actual active principle of all fevers is morbid material in the shape of the poisons produced by germs circulating within the blood. Fever is classed as remittent, when it abates at intervals; it is intermittent when it ceases totally for a while only to recur. There are many forms of fever, including scarlet, typhoid, typhus, hectic, miliary, symptomatic, rheumatic, yellow, and malarial fevers. See separate references.

Fibrin. An essential element of vegetable and animal organisms, represented in the blood and other tissues.

Fibroid. An unhealthy growth of a fibrous character, as fibroid tumour.

Fibula. A slender bone of the leg, situated on the outer side of the shin bone. Its lower end forms the outer part of the ankle.

Fingers. Four of the five digits of each human hand, the fifth being the thumb or pollex. The first is the index-finger, generally employed in pointing out an object or enforcing an argument. Then we have the middle finger, the ring finger, and lastly, the little finger. All are opened and closed by powerful tendons and muscles proceeding from the wrist, over the palm, and along their own under-surfaces.

Fire. In case of being surprised by fire in a house, when the room is filled with smoke and flame, get as close to the floor as possible, where the air is almost always clearest. Crawl out as quickly as you can; and, in entering a burning apartment for rescue or other purposes, also crawl along the floor, enveloping the head in a thick, wet cloth, cutting holes for the eyes.

Fire, when clothing is ignited. Wrap in or roll on a thick rug or blanket, and on no account run out into the air or downstairs. Keep the head down to prevent the inhalation of smoke or flame as much as possible.

Fistula. A deep, callous, and narrow ulcer, generally following an abscess, in certain parts of the body, and forming an abnormal passage between some internal organ and the skin. The term is chiefly applied to a pipe unnaturally created between the bowel and the surface of the body by disease, which has worked its way down through the flesh into the intestine. Fistula is always an indication of poor general health, and largely attacks persons of sedentary habits. The matter is always one for prompt operative attention, in association with the endeavour to improve the patient's general condition.

Flaccid. Wanting in tone, soft and yielding to the touch, as relaxed and unhealthy muscular tissue.

Flatulence. "Wind" generally in the stomach and intestines through imperfect digestion and various other causes often productive of serious inconvenience and severe pain. There is generally fermentation as

the result of decomposing food-stuffs of an unwholesome or improperly blended character at the bottom of the mischief. Some foods are particularly conducive to the flatulent condition, starches particularly, and these should be avoided by all those whose stomachic equipment is not particularly strong. Stews and soups, and over-infused tea are all "windy" things. Flatulence is better prevented than cured; but its painful effects may be alleviated by charcoal, which absorbs the troublesome gas whilst staving the decomposing and fermentary generative processes.

Flatus. The wind, or gas, in the intestine in flatulence.

Flexora. Such muscles as assist in the bending of any limb or part of the body.

Fluoric Acid. An acid obtained from fluor spar, usually now known as hydrofluoric acid.

Flux. A running, flow, or discharge; an extraordinary evacuation from any part of the body. The term is one very seldom employed nowadays.

Foliolate. A small gland or bag, as at the roots of hairs.

Fomentation. A simple yet often efficacious method of applying moisture to the body for the alleviation of pain. Hot fomentations are of good service in the relief of inflammatory and spasmodic internal affections, especially of the abdomen and chest. The most approved way of procedure in fomentation is to fold about half a dozen piles of flannel of suitable dimensions upon a towel laid over a hand-bath; the flannel is then saturated in heated water, medicated or otherwise as may be advisable, and enclosed in the towel. Two persons are then employed in expeditiously wringing out the superfluous moisture. The flannel should then be spread out, and if the pain be very considerable, a few drops of laudanum may be sprinkled upon it before applying it, as hot as the patient can bear, to the affected part, covering with several layers of dry flannel to retain the heat. An indiarubber hot-water bag full filled is a better covering for the saturated flannel if it be desirable to maintain the heat for a considerable time without interrupting or changing the fomentation. Turpentine, poppy-heads, and other anodynes are useful in fomentation as well as laudanum, and the sponge and cotton-wool are sometimes substituted for flannel as the medium. Cramp and colic, erysipelas and filling abscesses are usually greatly relieved by fomenting; so are bad sprains and bruises.

Food as ordinarily partaken of in varied forms by civilised human beings, may be classed under two principal heads, that which is nitrogenous in character and that which is non-nitrogenous. The former is flesh-producing, and comprises the most valuable constituents of meat and bread; non-nitrogenous, respiratory, and heat-giving food is mainly supplied in the shape of starch, sugar, fats, and oils. For digestive and assimilative purposes, mixed foods are best adapted to our wants, and the first natural aliment, the maternal milk, contains nitrogenous and non-nitrogenous elements combined in sufficient strength for the period of life. Fresh animal food is much more nutritious than vegetable food, and more easily digested, yet is retained longer in the stomach. Vegetable food passes quickly out of that organ into the small bowel, where its digestion is completed. Vegetables are particularly important in dietary, as they contain and supply certain salts and other inorganic substances which are essential to the development of bone and furnish to the blood materials of a disease-preventing character. Water is also an important article of food and enters largely into its composition. Sugar and starch consist of carbon, hydrogen, and oxygen, and are the principal of the respiratory and heat-producing foods. Butter and oily substances not only greatly aid in keeping the fire of life a-going, but build up the fatty tissues necessary to health; and also aid in the digestive processes. The nitrogenous foods are mainly made up of fibrin, legumin, gum, casein, and albumen. Salt is necessary to the blood as an element of preservation and nourishment.

Forearm. That part of the arm between the wrist and elbow, composed of two bones, the radius and ulna, and their accompanying fleshy tissue. The

wrist is articulated by the radius with the forearm, which enables the hand to rotate.

Fracture. The breakage or rupture of a bone. This not uncommon, but always painful, accident may be of simple comminution, as when the bone is cleanly divided without splintering or external wounding; or compound, if the bone be broken or "smashed" in its integuments. In compound fractures the skin and soft tissues are torn, and there may be a portion of splintered bone forced through the flesh. A comminuted fracture consists of the bone being broken or crushed into several pieces. A compound comminuted fracture not only has the bone so broken, but flesh wounds of a more or less extensive character in connection with the breakage. That a bone is broken may usually be readily seen by the distortion or deformity produced, or heard by the crepitus or peculiar grating sound occasioned on the fractured ends moving upon each other. Both these conditions, with loss of power over the limb or part in which the bone is situated, together with unnatural mobility being present, fracture is certain; and a surgeon should be summoned to set the bone, the sufferer being laid in the most restful position possible to await the doctor's arrival. It is necessary to exercise very great care in moving the patient, or a simple fracture may be converted into a compound one, and a compound fracture which was not comminuted become so. A shutter or wide board should be placed under the injured limb for its support, however short a distance it be requisite to convey the injured person. There is usually considerable swelling in connection with a fractured bone, particularly if the damage done to the soft tissues by crushing or tearing be extensive, and a broken rib may occasion swelling all over the body if a fragment of the bone should have penetrated the lung, permitting air to escape from that organ into the cellular tissue. The clothing of the injury pending the doctor's coming, with cloths wrung out in a solution of carbolic acid or some other antiseptic, may prevent suppurative later on.

Frænum, a membranous fold connecting an organ with other parts of the body, as of the tongue.

Friction and Massage of the skin is very often conducive to health, in accelerating sluggish circulation or promoting bodily heat, and it forms an important part of curative massage. Rubbing is also beneficial in stiffness of the joints or muscles. Friction may be applied to the body by the hand, with flannel or rough woollen gloves, or with the flesh brush.

Fruit is very valuable in a dietary. Many fruits are gently laxative, many others contain salts and acids possessing properties beneficial to the blood. The most wholesome fruits are apples, pears, gooseberries, currants (red and white), grapes, apricots, peaches, strawberries, and oranges; all, of course, when quite ripe, the softer, mellowed and fresher the better. Plums, cherries, melons, and all kinds of nuts, though nutritive in different degrees, are difficult of digestion, generally speaking, and black currants, when raw, have a disagreeable effect often upon the bowels. Some fruits, otherwise objectionable, may by cooking undergo conversion into excellent foods, as baked culinary apples, and unripe or dried berries of various kinds.

Galaetia, a morbid production, or overflow of milk.

Gall, the bile, a bitter, yellowish-green fluid secreted by the liver.

Gall Bladder, a membranous pear-shaped bag, attached to the under side of the right lobe of the liver, large enough to contain one to two ounces of the gall liquid. It acts as a reservoir to receive the surplus bile from the liver during the intervals of the active digestive process.

Gallie Acid is useful in the spitting or vomiting of blood. In the latter case it may be taken in ten grain doses in milk or water, and in the former along with fifteen drops of dilute aromatic sulphuric acid in water alone.

Gall Stones, or biliary calculi, are congealed masses of bile substance incapable of passing along the duct as they would do in their naturally fluid state, and have to be forced through by the severe spasmodic

contractions of the canal, which occasion such acute pain to the subject. The gall bladder becomes distended, and much of the bile is absorbed by the blood, giving to the sufferer, a jaundiced appearance. Large or repeated doses of olive oil have been administered very successfully for the relief of this distressing ailment.

Galvanism, that form of electrical excitement by chemical action, generally called voltaic electricity.

Ganglion. A knot-like process formed by a mass of nerve-cells; or a hard encysted tumour, situated in the course of an extensor tendon. Anatomically the term applies to the minute centres abounding throughout the body; and surgically to elastic swellings which appear at times on the top of the foot and on the wrist, reaching the size of a hazel nut, and yielding to pressure.

Gangrene. Incipient mortification, a term applied to the death of the tissues, following disease of the part, which becomes black and void of sensation. Amputation beyond the seat of the mischief is nearly always essential.

Gargle. A wash for the throat, astringent, antiseptic and soothing. In early stages of inflammatory affections astringent gargles, with antiseptic combination, are very useful as alleviative treatment, removing mucus. Hot water, with bicarbonate of soda in solution, is frequently employed; and chlorate of potash in solution, and associated with borax, will allay ulceration. Alum, dissolved in water, and diluted glycerine of tannin, form valuable astringent gargles; and an efficacious admixture for general gargling purposes is a wineglassful of warm water with twenty-five to thirty drops of sulphurous acid. It may be employed frequently without fear of harmful effect.

Gas. A vapour retaining elasticity permanently at ordinary temperatures, and distinguishable from non-gaseous vapours which become aeriform only under the action of heat. The gases most frequently encountered in considerations of health are oxygen, hydrogen, nitrogen, carbonic acid, chlorine, and ammonia, to all of which reference is made elsewhere in this dictionary.

Gas, Suffocation from. Suffocation from the inhalation of escaped gas should be combated by removal to the fresh air as speedily as possible. The sufferer must be kept warm, and made to lie down, frequent draughts of ammonia, twenty drops to a tumblerful of water, being administered until relief is obtained. Tincture of nux vomica, two to four drops an hour at first and less often later, may also be given in obstinate cases of suffocation from this cause, but a doctor should be called in unless improvement be manifest.

Gastric. Appertaining to the stomach, as gastric arteries, gastric juice, gastric fever, etc.

Gastric Fever. Another name for **Typhoid Fever**, which see.

Gastric Juice. A fluid containing pepsin and hydrochloric acid, secreted in the interior of the stomach, and forming a principal agent in the digestive process, during which it is distinctly acid, though it possesses neither acid nor alkaline reaction on removal, but has a saline taste. The juice is transparent and slightly viscid. It converts nitrogenous foods into substances called peptones.

Gastric Ulcer. Frequently occurs in young females, the symptoms being stomachic pain accompanied by vomiting of matter of coffee-ground like appearance, a condition due to the presence of blood. Ice will check the nausea and vomiting; and small doses of morphia and bismuth may be administered with good effect; while milk is the best food, for no solids should be taken until the ulcerous trouble has been overcome.

Gastritis. Chronic inflammation of the stomach, frequently occasioned by continuous alcoholic indulgence, though it may arise from gout or other disease, or be produced by strong purgative medicines or indigestible food generally. Excessive thirst, restlessness, and local pain are symptomatic of gastritis, while dilute hydrocyanic acid, administered in soda-water, is remedial.

Gastrocele. A hernial tumour occasioned by the protrusion of the stomach through the abdominal wall.

Gastrocnemii. Muscles forming the greater portion of the calf.

Gastrography. The sewing up of abdominal wounds.

Gastrohæmorrhagia. Gastric hæmorrhage.

Gastrotomy. Surgical dissection or cutting open of the stomach.

Gathering. Suppuration. (See *Whitlow*.)

Genioglossi. Muscles controlling the projection of the tongue.

Gentian. An Alpine root yielding tonic infusions and tinctures, very useful in pharmacy. As a stomachic, two to four grain doses of the extract, taken three or four times daily, are often administered with advantage.

Germs of Disease. The germ theory has received in recent years an immense amount of scientific study, with very great advantage to the suffering race. The result of research points to the conclusion that every disease is due to the presence in the system of some specific microscopic organism. Some of these microbes obtain access to the body through the respiratory organs or enter the circulation through abrasions of the cuticle, but the majority come into the system uninvited by the front door, so to speak, that is, at the mouth, and are swallowed in the saliva, or when eating or drinking. A vigorous and healthy frame furnishes the minute intruders with comparatively little opportunity for harm-doing; a debilitated condition of their unwilling host, organically or generally, gives the microbes their chance of development and multiplication. That is the germ theory of disease in epitome.

Gerontoxon. An ulcer of the cornea, of frequent occurrence in old age.

Giddiness, or Vertigo, a feeling of lightness in the head, accompanied by a tendency to reeling and falling. Objects appear to swim round, and the sensation is frequently experienced in looking down from a great height, or it is a marked premonitory symptom of many disorders or diseases. It may result from blood plethora or fulness or from blood deficiency, impaired or interrupted circulation, sudden change of posture, or be an accompaniment of indigestion. A rush of blood to the brain will occasion giddiness; an abnormal slowing of the supply is an even more frequent cause. In the first instance, the necessity of abstinence or the use of purgatives is indicated; where giddiness arises from weakness, tonic treatment is essential.

Ginger possesses stomachic and carminative properties, and exerts a slightly stimulative effect upon the biliary secretion. It enters into the composition of "Gregory's Powder" and other medicinal mixtures. In flatulence it is remedial, and in combination with opiate combats colic.

Glabella. The space between the eyebrows, so named from its smoothness and usual freedom from hair.

Glanders. A malignant disease of the horse, communicable to mankind through erosions of the skin. The germs may also be inhaled from the diseased nose-secretions of the horse. Always fatal in the case of the animal, which must be destroyed upon its appearance to prevent the spread of the malady. A case of glanders should be approached with great caution.

Glands. Soft bodies diffused over the system, and generally secreting some fluid. Lymphatic glands are found in the neck, the armpit, and groin, and these are liable to inflammation and suppuration. Some glands, as those of the spleen, seem to act only as blood reservoirs; others, as of the kidneys, pancreas and liver, are provided with ducts for the conveyance of the fluids they secrete to their ultimate destination; while the glands of the intestines take up the digested food properties into the circulation. When the mesenteric glands are the seat of inflammatory disorder their condition is usually due to tubercular deposit, a remark which also applies to affections of the neck glands. Muricite of calcium taken after food is a valuable medicine in almost every glandular ailment.

Glauber's Salt. A variety of Chicken-pox.

Glauber's Salts. Sulphate of soda, employed as a purgative, though not now so frequently as was formerly the case.

Glaucoma. A disease of the eye, in which the crystalline humours assume a greenish hue.

Globus Hystericus. The "ball in the throat" in hysteria, due often to fainting.

Glossitis. Inflammation of the tongue.

Glottis. The narrow opening at the top of the trachea, or windpipe.

Gluten. The nitrogenous proximate element of wheat and bread, constituting its most nutrient property. It is found in oats and barley and other cereals, but in wheat in the greater proportion. In its composition it has close alliance to the flesh of animals. Glycerine. A sweet fluid, obtained from fatty matters, and much employed in pharmacy. It has an emollient effect upon the skin, and forms a very useful adjunct to cod liver oil as a medicated food in pulmonary consumption. Upon the bowels it exerts a slightly laxative effect, and is administered beneficially for catarrh of the alimentary and bronchial canals. In thrush it goes well with borax as a mouth application, and combined with tannin is good for relaxed sore throat. Glycerine is also useful as an injection in obstinate constipation, and forms a convenient solvent of carbolic and other acids.

Glyster. An enema.

Godfrey's Cordial is a preparation, the active ingredient of which is laudanum, and its indiscriminate use as a remedy for pain in children has frequently wrought mischief. Opium in any form is a dangerous drug to administer where its strength is unascertained, and particularly where knowledge as to its applicability to a particular case is lacking.

Gout. (See *Bronchocele*.)

Gomphiasis. A disease in which the teeth fall from the sockets.

Gomphosis. Immovable articulation of the bones.

Gonitis. Inflammation of the knee.

Goulard's Water. Solution of acetate of lead, a valuable soothing lotion.

Gout, Arthritis, or Podagra, a painful inflammatory disease of the smaller joints, especially of the foot, sometimes extending also to the stomach, periodically and intermittent, and generally of hereditary origin. Its foundation is in the digestive system, and the natural outlet of the poison of gout is the kidneys, which fail to eliminate uric acid when it exists in undue proportion in the blood. Consequently it deposits itself in the joints or elsewhere, and sets up the inflammation technically termed the "explosion of gout." Severe throbbing pain in some joint, generally at the back of the great toe, is accompanied by feverishness, irritability, depression, thirst, a rapid pulse, and much suffering of a paroxysmal character; and this condition becomes in many cases chronic. A white concretion will frequently establish itself in the finger joints, rendering them stiff and unwholly. The heart and brain may become affected, and partial nervous paralysis supervene. A specially light and careful dietary is essential to gouty subjects, and menthol, chloroform, and belladonna liniment will often relieve the most painfully affected parts. Lithia benzoate, with colchicum tincture after meals is beneficial, and opiate may be administered carefully when the disease is most troublesome.

Granulations. Grain-like fleshy bodies which form upon ulcers, filling up and promoting the healing of the sores. When the granulation proceeds too rapidly what is called "proud flesh" is formed, arresting the healing, whereupon cauterisation has to be resorted to.

Gravel. A term popularly descriptive of disease of the bladder attended with the formation of calculus, or stones. The urine is highly acid, and crystals of uric acid or particles of lime, ammonia, and urate of soda become suspended within the fluid, aggregating into masses of considerable size, and creating irritation, inflammation, obstruction, and often occasioning excruciating pain. Gravel frequently follows dyspepsia, or is an accompaniment of rheumatism, and often, in its pronounced stages, calls for surgical interference. Bi-carbonate of potash or lithia is a valuable palliative; and hot baths may afford relief in the paroxysms of pain, opium also being administered under advice.

Green Sickness. A distressing form of anæmia.

in young females subject to chronic constipation. (See *Chlorosis*.)

Gregory's Powder. A combined purgative and stomachic, acting also with tonic and antacid effect upon the alimentary canal. It is formed of one part-ginger, four parts calcined magnesia and two parts of starch. It is a most useful medicine, and its disagreeable flavour may be greatly modified by the addition of a few drops of brandy or eau de cologne.

Gray Powder. The Hydrargyrum-cum-Creta of Pharmacy, is an admirable aperient or alternative medicine for children, either alone or in combination with rhubarb, jalap, or other purgative drugs; while for adults it is a serviceable medicine in disorders of the liver, skin disease, or inflammation generally. It is prepared by rubbing together in a mortar two ounces of chalk and one of mercury until all the globules of the latter are thoroughly pounded and amalgamated with the former.

Griffith's Mixture. Compound iron mixture is one of the best medical preparations of iron; this mixture is compounded of sulphate of iron, carbonate of potash, spirit of nutmeg, myrrh, sugar and rose water. It lies lightly on the stomach, and does not induce subsequent constipation. In debility it is very beneficial, and is specially recommended for chlorosis, or green sickness.

Grippe. The French appellation of Influenza, employed often in Britain and America in denominating the epidemic phase of that malady.

Gumboils, so called, are really abscesses relating to decaying teeth or disorders of the alveolar process, and occasion very severe pain because of the tension they produce. Lancing will afford relief, but they are very apt to recur unless the tooth whose decay gave rise to them be extracted.

Hæmaturia. A passage of blood with the urine, which may proceed from the bladder or kidneys, if from the latter organ, the water is smoky-looking.

Hæmatæmesis. Bleeding from or into the stomach, the vomiting of blood, distinguished from hæmoptysis, the spitting of blood from the lungs. It is a peculiar circumstance that the stomach will not long retain fresh blood; consequently alarm is often occasioned by what appears to be blood vomiting when what is brought up is really the result of bleeding from the gums or the back of the nostrils, the stomach rejecting the swallowed blood. Blood from the stomach is dark coloured and clotted. At times the ensanguined vomit resembles coffee grounds through having undergone partial digestion, which is of course an indication of its having been in the stomach.

Hæmoptysis. Bleeding from the lungs, generally an indication of consumption or ulceration of the blood vessels of the lungs, and always a condition of considerable gravity. The blood is frothy and of light colour.

Hæmorrhoids. Piles, with effusion of blood. These tender and painful swellings and protrusions of the extremity of the bowels occasion very considerable inconvenience and irritation in walking and other bodily movements. They commonly arise from, and are, an accompaniment of constipation, and evacuator action increases their soreness and causes them to bleed profusely, the blood generally being bright red. In all cases of external piles considerable benefit may be derived from the application of ointment of galls or some soothing non-irritant lotion; and the employment of simple aperients, such as castor oil or lenitive electuary, for the diminution of fulness in the vessels of the lower bowel will generally have a comforting effect. Cold water enemata are recommended, with light and careful dietary, and thorough antiseptic lavation of the parts.

Hæmostatica. Stagnation of the blood; hence hæmostatica styptica, or medicines employed to stop hæmorrhage.

Hare Lip. A longitudinal fissure of the upper-lip, similar to that of the hare, sometimes styled "cleft lip," and often an accompaniment of cleft palate, deformities due to the arrest of development before birth. It is amenable to surgical treatment, which should be resorted to without delay.

Hæmatoma. The popular appellation of ammonia, which has so many uses in pharmacy.

Hay Fever. Called also "hay asthma," a catarrhal complaint, characterised by all the symptoms of a severe cold in the head, which affect the respiratory organs in a distressing manner. Some persons are particularly susceptible to this trouble, which is most frequently met with in the hay season, and is supposed to be consequent upon the presence of irritating pollen-particles in the air derived from plants. Fog will produce very similar effects at times. There is suffusion from the eyes, sneezing, cough, and more or less constant headache. Quinine is a good tonic in this affection, with inhalations of ammonia, or the vapour of carbolic acid.

Hæmorrhage. A distillation from the fresh twigs of the witch hazel forms a powerful astringent, having a very beneficial effect upon enlarged veins, such as bring about hæmorrhoids and varicosity in the leg veins.

Headache. Arises from many causes, the chief of which are indigestion or biliousness, nervousness, neuralgia, debility, rheumatism, or a disturbing blow. Bilious headache is relieved by aperient treatment or an emetic, by the application of cold to the head (or hot salt will in some cases be successful), a warm bath, or perfect quiet, with a draught of strong tea or coffee, a brisk walk being taken when the headache has subsided. Sal volatile is useful for nervous headaches. Headaches arising from debility following excessive brain-work call for complete rest and tonic treatment. Neuritic headaches, accompanied by throbbing or shooting pain over the eyebrows, may be relieved frequently by taking bromide of potassium quinine. Rheumatic headaches generally affect one side of the head only and are paroxysmal in character, with tenderness upon pressure at the seat of pain. General treatment for rheumatism is necessary for their cure.

Heart. The vital muscular ball—about the size of a closed fist—lying in the pericardium bag, almost surrounded by the lungs, and a little inclined to the left side of the chest, is the great pump which forces the blood through the arteries, capillaries, and veins, through the lungs, and back to itself. It is divided into four cavities, the upper pair called the auricles, and the lower the ventricles; each of which is capable of containing from four to six ounces of blood. The heart contracts and expands in health over a hundred thousand times daily, and its action goes on uninterrupted during sleep as well as when the individual is awake. The heart cavities communicate with each other by orifices, whose valves maintain the circulation of the blood only in one direction. This most important of all the vital organs is subject to many diseases. Fatty degeneration is usually accompanied by a similar condition of the kidneys and liver, and produces a tendency to syncope, which may be sometimes averted by sal volatile. Valvular disease will often result from rheumatic fever; and pericarditis, or inflammation of the investing serous membrane of the heart, is always liable to occur in this malady, bringing about great difficulty of breathing and oppressive pain. Endocarditis, inflammation of the under-lining heart membrane, is particularly dangerous. Enlargement of the heart arises from frequent participation in protracted or violent exercise. Angina pectoris, or heart spasm, generally associated with dilatation, i.e. fatty degeneration, is due to impediment in the circulation of the blood-vessels which nourish the heart. It is a very grave malady. Palpitation of the heart, a common ailment, is often attributable to flatulence, or digestive disturbance, and may be prevented by attention to the cause.

Heartburn. An acrid, burning sensation at the pit of the stomach and top of the gullet, technically called cardialgia, is a symptom of dyspepsia or indigestion. It occasions considerable uneasiness, and often brings about eructation, with "water-brash." In pregnancy it is of frequent occurrence. Temporary relief may be obtained from carbonate of soda, potash, or other correctives of an acid condition of the stomach, but careful dietary is requisite, avoiding acids and sweet foods, wherever heartburn—which has nothing to do with the heart—occurs.

Hectic Fever. Is a remittent and exacerbating febrile condition, attended with chilliness, heat,

perspiration, and clamminess in alternation. Consumptive patients are often hectic, as the bright red spot on their wasting cheeks painfully indicates, affording presage of impending death. Hectic pyra is the scientific term for hectic fever, which is not so much a disease as a symptom of an unmistakable character.

Helleborine. An alkaloid, employed in pharmacy, and obtained from the root of the Christmas Rose.

Hemeralopia. Loss of sight at night.

Hemicrania. Neuralgic pain on only one side of the head. May be frequently relieved by galvanism, phenacetin, quinine, or other anti-neuralgic treatment, but, as it usually arises from a generally low condition, it should be regarded as symptomatic, and combated accordingly. (Also called *Migraine*, see *Headache*.)

Hemiplopia. Partial vision, in which the whole of any object cannot be seen at one time.

Hepatic. Pertaining to the liver; hepatitis, inflammation of the liver; hepatocoele, a hernial affection in which a part of the liver descends through the abdominal walls, not unfrequently found in new-born children.

Hernia. By this term is distinguished that condition of the abdomen in which the bowel protrudes through the parietes or walls, commonly called "rupture." Hernia, of course, appears most frequently where the parts are weakest, and where important vessels pass outwards in the groin region. It is usually the resultant of strain in lifting, jumping, or the jolting of riding, and is first observable as a soft compressible tumour, unattended with pain unless strangulated. This tumour goes back in the abdomen during rest in the recumbent position, returning on resumption of activity. It may be kept from causing inconvenience in this reducible state by wearing a properly-fitted truss.

Herpes. The Tetters, an eruption of the skin, as in ringworm erysipelas, and arising from an inflammatory ailment of the extremities of certain nerves. The eruptions commence by filling with clear fluid, which becomes opaque and hardens later—coming away as a crust. Herpes frequently appear on the lips and cheek, when it is termed scientifically herpes labialis; shingles is herpes zona or zostor, and appears upon the trunk when its vitality is low.

Hiccough, or Hiccup. Is due to a contraction of the diaphragm or muscular floor of the chest. Drinking water will often stay it when it is a temporary inconvenience arising from indigestion. Its occurrence at the crisis of acute disease is usually a very grave matter, indicative of approaching collapse.

Hip Joint Disease. A very painful affection to which children of low vitality and tuberculous habit are liable. It arises from tuberculous disease either in the joint or its immediate vicinity, resulting in the formation of pus, which may find an outlet at some considerable distance from the seat of the mischief. The ailment frequently first manifests itself in occasional stiffness and pain in the joint, the foot evidencing a tendency to drag or turn outwards. As the disease makes progress pain increases and extends, and is frequently excruciating in the knee, even at times being felt more acutely whilst no considerable inconvenience is perceptible in the hip itself. Examination will show the injured leg to be slightly longer than the other, and a sharp tap to the sole or on the top of the hip-bone will greatly increase pain in the knee and hip joints. Later the leg is drawn up shorter, and abscesses form about the thigh, sometimes extensively, and of a very weakening character. There is frequently prostration and hectic fever; and unless the malady be arrested, death will often ensue. Recovery is only in many cases attained at the expense of permanent stiffness of the joint. Treatment consists of securing complete rest to the diseased part, with nourishing dietary and tonics, such as cod liver oil, steel, &c. The patient has to be kept lying down, with the injured leg extended and supported by sand-bags or splints, the inflamed surfaces being held as far as possible out of contact by a hanging weight carried over pulleys at the bed foot attached to the extremity of the affected limb.

Hippus. An affection of the iris, of a spasmodic character, occasioning repeated dilation and contraction.

Hives, The Group, The "Rashes." A term also applied occasionally to *Chloasma-pem*.

Hoarseness may result from overstraining the voice in singing or speaking, as well as from common catarrh or cold. Rest and inhalations of hot water (at a temperature of 120 degrees) with confinement to a warm room for a day or two will generally correct this condition, especially if combined with the internal administration of judicious doses of chlorate of potash.

Homoeopathy is a medical theory aiming at producing in a patient affections similar in their nature to those from which he is suffering on the principle of "like curing like." Homoeopathy relies on drugs in small doses. Hahnemann, of Leipsic, working on the observations of Hippocrates, was the founder of modern Homoeopathy, which has had considerable influence upon medical practice. Thus quinine, which will, in the healthy, occasion febrile symptoms resembling ague, has been largely resorted to for the relief of ague.

Whooping Cough, or "Whooping Cough." is an infectious ailment commencing with what is usually called a "common cold," and developing in a few days, after the subsidence of febrile symptoms, into a cough of a spasmodic and often violently paroxysmal description, with the characteristic "whooping" inspiration at the close of each coughing fit. The malady reaches its height in ten to twelve days, when it gradually abates, but seldom leaves the patient for some weeks, and is liable to recurrence.

Hordeolum. A sty or tumour on the eyelid resembling a barley corn in shape.

Housemaid's Knee arises from swelling over the knee cap, due to inflammation of the bursa, or pad over the knee cap, consequent upon frequent kneeling upon hard surfaces. Blistering will generally afford relief, but rest of the part is essential to cure.

Humerus. The long bone of the arm reaching from the shoulder to the elbow, hence "humeral," belonging to the shoulder. The humerus is frequently the subject of accidental fracture, and the setting of the injured bone usually presents but little difficulty to the skilled surgeon.

Humour. Fluids of the body. A term usually employed to indicate such fluids in a vitiated condition.

Hydatid. A transparent bladder or vessel on the body, filled with water, as in dropsy. Also a stage in the development of tape-worms. These are introduced in eating or drinking, and undergo their first stage of development in the stomach. Penetrating the coats of the stomach or intestines they find their way into the circulation and locate themselves in the tissues of the muscles, eye, brain, liver, or some other organ, where they become encysted, and sometimes cause much mischief and even fatality. The hydatid cysts in animal tissue, taken in that condition as food, are liberated in the stomach in their final state as tape-worms, and then produce intestinal disturbance.

Hydroaerugia. Purgative medicine acting powerfully upon the mucous membrane of the bowels, and the portal veins. Cream of tartar is a familiar example of this class of drug.

Hydrocele. A dropsical condition of the scrotum, due to inflammation of the serous lining membrane, which usually calls for surgical attention.

Hydrochloric Acid. Also called "spirits of salt" and muretic acid, it is composed of one equivalent each of chlorine and hydrogen, obtained by distilling common salt with sulphuric acid. Used in medicine in a diluted state.

Hydrocyanic Acid. The technical name of the deadly poisonous prussic acid, a very valuable ingredient of some medicines, in small and careful doses. It acts as a stomachic sedative properly applied, and is one of the components of chlorodyne. Hydrocyanic acid is a compound of hydrogen and cyanogen.

Hydrogen Gas. The lightest known substance, has neither taste, smell, nor colour in a pure state; it forms the ninth part in weight of water, and enters largely into the composition of all animal and vegetable

bedies. It burns with a pale yellow flame, and in its combining unites with oxygen, forming water. Combined with sulphur, it forms sulphuretted hydrogen gas, soluble in water, but deadly on inhalation.

Hydrozephrosis. Dropsy of the kidneys.

Hydrotherapy. That method of treatment in medicine in which the external application of water, by bandages, compresses, douches, the body and trunk, pack and baths, hot and cold, is relied on; the administration of hot and cold water, medicated or otherwise, internally, being supplementary. It is a valuable hygienic system, especially where judiciously employed in alliance with skilful general therapeutic practice.

Hydrophobia. Disease caused by the bite of animals, dogs, wolves, and cats, in a rabid state, and specially characterised by the dread of water, whence its name. It is only conveyed by inoculation direct from the fangs of the affected animals to the human blood, and may appear in a bitten person long after the superficial healing of the wound. An uneasy, tingling sensation appears in the neighbourhood of the injury, followed by constitutional disturbance, depression, a choking feeling about the throat and neck, and great difficulty in swallowing fluids. Then spasms of the throat, the dreadful horror of water, and exhaustion supervene, ending in agonising death. The poison appears to act upon the spinal cord, and so to affect the whole system. Caustic treatment, and that immediately, of wounds from the fangs of a rabid animal, is eminently desirable, pure carbolic acid furnishing the most effective cautery. The Pasteur system of injecting attenuated poison sub-cutaneously to persons bitten has succeeded in overcoming the potency of the poison from the bite. Of course all mad dogs should be destroyed as speedily as possible.

Hycosyamin. An alkaloid extensively employed in pharmacy, and obtained from henbane.

Hypochondrium. The sides of the abdomen, under the cartilages of the false ribs, covering the region containing the liver and stomach.

Hypochondriasis. A disease characterised by melancholy, debility, and dyspepsia, usually associated with sluggish action of the liver. Treatment of the "hipped" consists in the restoration of the digestive machinery to its normal condition.

Hypodermic. Underneath the skin, the term used to denote the administration of the various medicines cutaneously, by means of a perforating needle and injecting syringe. It is an efficacious and speedy method of introducing into the system certain curative agents such as morphia, atropine, cocaine, strychnine, etc.; and antiseptics are frequently hypodermically injected with advantage. A qualified practitioner only should use the hypodermic syringe.

Hypopygium. A purulent affection of the eye.

Hysteria. A morbid condition indicated by fatality and the feeling of a lump or ball in the throat causing a sense of choking or suffocation. Involuntary laughing and crying precede the hysterical fit, in which the patient tosses about violently, and is liable to self-injury. A fit of hysteria very often ends in the sufferer going off into stupor or coma, and sometimes this state is reached without preliminary signs. Hysteria is a curious ailment to deal with, being a nervous affection which feeds upon itself, and simulates many diseases. It is always best to exhibit no sympathy with the patient, who is generally a female, but to throw cold water upon her face, apply ammonia to her nostrils, and administer anti-spasmodics.

Ichor. A thin watery humour discharged from an ulcer, acid and irritating. Unless cleansed away or absorbed by an antiseptic it will retard healing and spread the sore from which it proceeds. The raw surface of the wound which excretes ichor should be gently washed or dabbed with dilute carbolic acid, iodoform, or, preferably, aristol being thereafter applied.

Ichthyopsia. A disease of the skin which develops scaly surfaces not unlike the skin of a fish. This disagreeable disorder is often hereditary, and it is more frequent in certain districts than elsewhere. It is very intractable to treatment. Sufferers therefrom should

regulate their dietary so as to keep the blood as pure as possible, and indulge but little in very salt or highly seasoned food.

Iliae Passion. A distressing ailment in which, owing to the obstruction of the bowels, the food returns to the stomach, and is afterwards vomited. There are gripping pains and abdominal spasms. Warm baths and hot fomentation may afford temporary relief, but these cases require prompt and skilful medical treatment, as iliae is more a symptom than a disease.

Ilium. The last portion of the small intestines, hence also iliac region.

Imperial Drink. Is the name by which a mild laxative with an excellent effect upon sluggish kidneys is known. It is made by pouring a pint of boiling water over a sliced lemon and half an ounce of cream of tartar. After cooling, strain the fluid, which is always useful as a refreshing drink in slight feverishness and in cases where the urinary secretion is at all deficient.

Impetigo. Is a cutaneous eruption, attended by itching pustules of a yellow colour, which become crusted and scaly. It has affinity with eczema, and arises from a vitiated condition of the blood requiring medical treatment. Local relief may be obtained from the use of an ointment containing nitrate of mercury, quinine, and chrysarobin.

Incisors. The cutting or front teeth.

Incontinence of Urine. Is frequently met with in young children, and during debilitation from old age or disease. It may be the result of neglect and undisciplined habits, but is more frequently due to weakness or spasm of the muscular sphincter of the bladder. In that case graduated doses of perchloride of iron will be found strengthening and corrective. Worms and constipation are often contributory causes of incontinence of this disagreeable character, so that the condition of the bowels should always be regulated where it occurs.

Indigestion. Indigestion is answerable for a preponderating proportion of the ills of the flesh, and it is almost entirely a preventable condition. If individuals would systematically conform to a well-considered dietetic regimen, based upon adaptability to their constitution, and the circumstances of their avocation and environment, and would, moreover, give full attention to a daily and complete clearance from their bodies of the waste products of food, indigestion would cease to trouble and dyspepsia vanish. Treat the stomach well, and it will serve you efficiently unless organic disease be existent, when there must be specific medication in accordance with the particular requirement.

Infantile Fever. A remittent febrile complaint, common at teething time with babies, and usually called "Worm Fever." Worms may accompany the ailment or any other functional disorder of childhood, but this particular description of low fever is due not to the intestinal marauders, but to the constitutional disturbance attendant upon difficult dentition. Get the bowels gently and thoroughly cleared as quickly as you can, give a slight dose of flannel, and warm baths, combat the fever with nitre and ipecac, and quench the thirst with ice-water. If there be convulsion complications, get the doctor to prescribe specially, and follow his prescriptions. For the rest, nursing care must be relied on.

Infants. Warmth is very necessary to the young infant, therefore let it be comfortably clad from birth onwards, frequent changes of warm and warm as possible, being supplied. Let the washing of the child be carefully and systematically attended to, all the fastenings of its dress being easy, and see to its wholesome and regular feeding, with breast milk as the staple, if at all possible, for as long as that supplies sufficient nutriment; and thereafter, rationally selected and digestible dietary. Let it be dressed in a warm apartment out of all draughts, in a crib of its own. Keep its bowels in regular action. Give it as much out-door exercise in the sunshine as the weather will permit. Do not wake it from sleep for exhibition purposes. If it become cross and cry, find out the reason and remove it. The fault is usually yours, not

the child's. Be regular in all your attentions to baby, and baby will grow up to good habits. Do not try to get it on its feet prematurely, but let it lie on its back on a rug or mattress and kick and crawl to its heart's content, afterwards giving it freedom to creep and crawl properly clad. Do not try to "harden" it by exposure. Do everything you do in its behalf with deliberation and thought for the years to come.

Infection is contradistinct from contagion, in that the latter term implies the actual touching of the person suffering from communicable disease. Infection may come through the medium of air, water, or clothing, etc., but is chiefly the result of the inhalation or swallowing of germs. This may be rendered the less likely by cautious approach to an infected subject, and keeping the mouth closed is consequently advisable when one knows danger to be existent. Breathe through the nostrils only, and do not swallow the saliva, making use of suitable disinfectants in a suitable way. Thus an infectious case may be visited by a person in robust health without disastrous results. There is always the risk that the ubiquitous microbe may find its way into your system, but the more care you exercise, the less likely will it be to make harmful incursion. (See **Contagion**.)

Inflammation. A redness and swelling in any part of the body, and usually attended by considerable heat, pain, and fever, with more or less engorgement of the blood vessels. It may arise from the direct introduction of some poisonous matter, or be occasioned by the absorption of septic material from without. It is a very frequent cause of both structural and functional maladies, and should be medically attacked at its inception to prevent complications later. In external inflammation the redness varies considerably in intensity as in extent. A line of demarcation between the inflamed and healthy surface is mostly wanting, the redness shading gradually off into the adjacent, the normally coloured skin. In erysipelas the inflamed tract may be very large. Increased heat in the affected part is apparent to the touch, or demonstrable by the clinical thermometer; and, curiously, inflammation usually produces a higher temperature at the extremities, situated at the greatest possible distance from the centre of the circulation, than elsewhere. Swelling will be variant from the hardly raised surface of erysipelas to the more obstructed elevation of the abscess or carbuncle. In soft surfaces there is relatively large puffing in inflammation, as the boil on the lip; while when it occurs under hard fibre, as in the whitlow of the finger, there is pain with little to show for it until the purulent matter makes its escape by the side of the finger nails. Deep-seated inflammation is most difficult to combat, of course, and most productive of painful disturbance. In the tissues below the true skin there is throbbing and intermittent heat with the pain; superficial inflammation induces itching and tingling, sometimes, as in ophthalmia and erysipelas, to an almost intolerable degree. If the seat of inflammation be a soft part, as what is styled the root of a tooth, embedded in firm tissue, the pain is very severe, and eye inflammations within the tough sclerotic coat are often agonising. In a depending part, as the foot, the pain of inflammation is more intense than where the blood flows freely; hence posture is very important in palliative treatment. Internal inflammation is denoted by local pain and tenderness over its region, with increased heat and functional disturbance, thirst, accelerated pulse, shivering and sense of chill within, and dry feverishness without, accompanied by failure of appetite. Inflammation may be acute or chronic. It ends either in subsidence or a suppurating swelling, discharging pus to its own relief. This may burst of its own initiative, or require poulticing or the lancet to empty it of its contents. The boil or abscess may be healthy, and quickly accomplish its scavenging work, or it may be sluggish and continue long, according to the nature of the mischief which induced the inflammation. Or the inflammation may proceed to ulceration of a more or less extensive character, each ulceration speedily coming to an end or yielding to treatment, also assuming an "indolent" and lingering form, and in cases occasioning fistula. Should there be no proper healing, gangrene and mortification will in due course supervene,

so that it is plain with what importance inflammation ought to be regarded. In modern views inflammation is regarded as the effort on the part of the body to throw off the poisonous or septic principles which have produced a diseased state.

Influenza, in its epidemic form, exhibits all the symptoms, at the commencement, of common catarrh. There is running at the eyes, nasal catarrh, frontal headache, feverishness, sneezing, and cough. There is more or less impeded respiration. But speedily there comes in influenza very great prostration, which may continue for some period after the abatement of the commencing features of the ailment. The disease is of very frequent occurrence in Northern Europe, hence it has come to be called Russian influenza. Quinine has been very much employed as a remedial agent, in combination with the usual palliatives of bronchial and catarrhal troubles; but the system requires a good deal of tonic treatment and upbuilding by generous dietary after a bad influenza bout; and change of air is very beneficial in the convalescent stage.

Infusion. The extraction of the active principle of substances by the agency of liquid without actual boiling, the latter process being termed decoction. Infusions employed in medicine include senna, cinchona, calumba, calomel, gentian, quassia, hop, broom, buchu, uva, ursa, and senega. Tea is a dietetic and stimulant infusion, and should never be left to "draw" for more than four minutes at the outside, or gummy matter and tannin will enter excessively into the infusion and prove injurious.

Inguinal. Pertaining to the groin, as inguinal glands, etc.

Inhalation of medicated vapour is very useful in ailments of the respiratory organs. An ordinary jug or the bruchitis kettle will serve for the generation of the soothing steam, or there are various forms of inhaler obtainable at the pharmacies. Camphor, eucalyptus, menthol, terebene, pumline, chloride of ammonia, sulphurous (not sulphuric) acid, and other volatile vapours are all serviceable in this form of treatment; and oxygen is sometimes administered by inhalation in grave cases with immediate good effect. Inhalation is also the chief method of producing anaesthesia prior to surgical operations.

Injection. Throwing or forcing a fluid into the body, as by a syringe. Used in injections into bowel.

Inoculation is the introduction of a foreign substance into the system by means of a wound, as the communication of the attenuated virus of cow-pox or "calf lymph" in vaccination. The inoculative principle has had enormously extended application in the healing art of recent years, for since compulsory vaccination was adopted as a State safeguard against the spread of small-pox, the researches of Pasteur and other scientists have led to the subcutaneous injection into healthy bodies of modified poison of diphtheria, tetanus, anthrax, pleuro-pneumonia, hydrophobia, and other diseases of man and animals, for the purpose of rendering their systems impervious to subsequent attacks of the malady thus in a mild form introduced. The inoculation idea met at first with very considerable antagonism, but it has made immense headway.

Inoculation. The union of two vessels of the animal body at the extremity, by contact or perforation of their sides.

Insects. (See **Stings of Insects**.)

Insensibility, Torpor, or Coma; that is, suspension of all external signs of animation.

Insomnia. Complete loss of sleep is one of the most troublesome ailments with which the doctor has to deal. Sedative drugs are dangerous. Change of air, scene, and occupation are usually the best correctives of prolonged sleeplessness. Regular hours, a well-ventilated sleeping apartment, proper dietary, and sufficient exercise will usually prevent insomnia. Where it has established itself, seek the advice of the physician, and follow it, or you will "wear out" through want of sleep. A mattress or a pillow is better than one of feathers in insomnia. Ward it off as much as you can, for it is often a sign of incipient insanity, which "tired Nature's sweet restorer," if wooed back again, frightens away.

Inspiration. The act or drawing air into the lungs. Sixteen to eighteen a minute should be the regular number of inspirations in a healthy adult, and this is about what is requisite for the proper oxydation of the blood. When the lung tissue is inspired, the number of inspirations are increased in order to enable them to accomplish their work. When breathing is more rapid than normal, and the circumstance is not due to a temporarily exciting cause such as strenuous exertion, then lung disease, or mischief in some of the contributory respiratory organs, may be suspected.

Intemperance is usually taken to express over-indulgence in intoxicating liquor, but the term in its wider sense embraces absence of control over the appetite, passions, and behaviour generally. Excess in eating, in language, or in action, are all intemperance, just as drinking beyond the bounds of moderation may become inebriety. The mischief of all such intemperance is too often demonstrated; the difficulty in a great many cases is to get people to abandon evil indulgence.

Intermittent. Ceasing at intervals, as an intermittent fever, paroxysm of fever, etc. Neuralgia and ague come into the category of intermittent ailments. Their paroxysms cease, leaving the patient in an apparently improving condition, only to return and disappoint his hopes. An intermittent pulse implies the missing of a beat occasionally, which may indicate nervous disorder consequent upon stomachic disturbance, or it may be due to heart disease. The matter is one calling for inquiry and rectification if possible. Over-indulgence in stimulants and tobacco will both contribute to interference with regular pulsation.

Intertrigo. A species of erythema, or morbid skin redness, induced by friction or chafing. Seen in infants often between thighs and buttocks.

Intestine. The digestive canal, extending from the stomach to the anus. In the intestine digestion is completed. The extreme length is twenty-six feet. The intestine is primarily divided into large and small, and the latter into the duodenum, jejunum, and ileum. The large intestine ending at the anus is again divided in scientific terminology into the cæcum, cecum, and rectum. Attached to the cæcum is the vermiform appendix, four to six inches long, about the thickness of a goose quill, tubular, and forming a cul-de-sac. There does not appear to be any use for this appendage; but it is frequently the seat of dangerous inflammatory disease, as are also the tissues surrounding it.

This gives the condition of appendicitis and allied maladies, sometimes requiring operative treatment. Numerous diseases affect the intestines proper, as catarrh, ulceration, rupture, stricture, inflammation, impaired muscular action, or atony with hæmorrhage, such as is frequent in typhoid. The rectum is liable to cancer, stricture, piles, and fistula; while the anus may be the seat of fissure and pruritis, a most irritating ailment characterised by itching. The individual diseases of the intestines, of their causes, as well as treatment, are dealt with elsewhere.

Intussusception. An abnormal or unnatural passing of one portion of an intestine into another, like the finger of a glove pushed in on itself; or, an anterior process of the assimilation of food.

Inunction. This is the process of rubbing in an ointment upon the skin, to obtain its absorption through the membrane. Ointments thus made use of are usually of an anodyne or narcotic character, such as cocaine, morphia, or atropine; or they may be mercurial, or mainly composed of iodine or some form of sulphur.

Iris. The coloured circle surrounding the pupil of the eye, opening and shutting according to the amount of light necessary to be admitted to the retina. (See *Eye*).

Itch. Inflammation of the iris.

Itch. A very disagreeable and irritating cutaneous disease, sometimes colloquially called "scaly tetter," but scientifically styled pruritis. It is an eruption of pimples in red patches, whitish-scaled, caused by the Acarus scabiei, a mite which burrows under the skin and there deposits its eggs. These take fourteen days to hatch, and upon emerging the female itch insects

immediately commence egg-laying on their own account, the process setting up a tortuous irritation upon the skin of the involuntary host. The softer and tenderer parts of the cuticle are selected by the Acarus for its incubatory enterprise, as the abdomen, the forearm, the back, and between the fingers. The ailment is highly contagious, but once contracted may be got rid of by a thorough-going remedial course. This consists of well rubbing the body, and especially the affected parts, with soft soap, plunging into a hot bath, soaking and washing and then rubbing briskly till dry. This opens the pores, and softens the skin. Now apply strong sulphur ointment or a lotion made of sub-carbonate of potash, one part, and sulphur, two parts, in lard. Rub this in freely and patiently where the itch troubles. Let it remain on all night. Take a warm bath next morning. Go through the whole process for three consecutive nights and mornings, and Mrs. A. Carus and her brood will bother you no more. Disinfect any clothing which has been near your itching skin by fumigation or otherwise.

James's Powder. A preparation of antimony much in vogue at one time in the treatment of febrile ailments, as an alterative and diaphoretic. Two parts of phosphate of lime to one of antimonial oxide enter into its composition, and it is usually given in three to twelve grain doses for an adult. Its action is not always certain, and other preparations have supplanted it to a great extent.

Jaundice. A complaint of a bilious character, producing a yellowness of the external parts of the body, and being a secondary result of disease in the gall-bladder, gall-duct or liver, or a form of blood-poisoning from an accumulation of bile within the circulation. It is almost invariably an accompaniment of gall stones. When jaundice is due to organic liver disease, and the symptoms are most pronounced, it is usually a sign of approaching death; but when it arises from cold or gall-stone obstruction, the complaint subsides upon the correction of its cause.

Jaw. In addition to dislocation, fractures and other ailments, to which the jaws, upper and lower, are liable, like the rest of the human frame, they are occasionally the point of manifestation of the dreaded and little understood tetanus, really a disease of the entire spinal system brought about in an obscure manner by nerve injury. (See *Lockjaw*.)

Jejunum. The second or central portion of the small intestine, between the duodenum and the ileum. It is about eight feet long, and receives its distinctive name from the circumstance of its generally being found empty after death. Its sole function is the absorption of nutritive matter.

Joints. or articulations, are the unions or junctions of any two adjacent parts of the body; but generally the term is taken to signify the connection established between contiguous bones. Joints, knitting the bones together to form the skeleton of the frame, may be either movable, immovable, or mixed.

Jugal Bone. The cheek bone.

Jugular Veins. Those that run on the sides of the neck below the ear, and by union with the sub-clavian, form the superior vena cava. They convey the blood from the head and face back to the heart; injury to these large veins is always serious, not alone because of the hæmorrhage which may be occasioned, but on account of the liability of the admission of air to the heart by the exhausting action of the right auricle. These vessels are frequently wounded in attempted murder or suicide by throat cutting, and in the old days a continual venesection bleeding was sometimes surgically practised from one of the jugular veins.

Keeping out Cold. (See *Cold*.)

Kidneys. These organs lie in the lumbar region, on either side of the spine, just below the liver, their upper end being in contact with the lower side of the diaphragm. They are about four inches long and a half inches wide, and are chiefly composed of fine tubes enclosed in a firm, dark red, fibrous capsule. Above each kidney is an organ called the suprarenal gland, affected in "Addison's Disease." The function of the kidneys is the secretion of the urine from the blood. The kidneys are supplied with blood vessels

which proceed directly from the aorta or main blood-vessel of the body. The glandular structure is so arranged that the ducts lead into a cup-like cavity called the pelvis or base of the kidney, which is continuous with the ureter, the tube leading to the bladder at the bottom of the abdominal cavity. The kidneys are subject to many important diseases.

King's Evil. An old name for scrofula, arising from the once prevalent superstition that the touch of a royal finger would cure the malady. Its distinguishing characteristics are enlargement and suppuration of the neck glands, often occasioning unsightly and indolent ulceration of the eyes and eyelids, with intolerance of light and copious tear-flow (a condition termed strumous ophthalmia) and wasting disease of the bony tissues and cartilage, particularly in the neighbourhood of joints, often giving rise to deformity.

Labia. The lips of the mouth; the red part is called the prolabium, and the cuticle epithelium.

Labyrinth. That portion of the internal ear consisting of the cochlea, or "snail shell."

Laceration. The act of tearing asunder, hence wounds in which the tissues have been torn are termed lacerated. Such wounds should be cleansed as thoroughly as possible immediately after they have been sustained and dressed with some anti-septic such as carbolic acid in solution. A dusting of aristol, iodoform, or boracic acid may then be applied and the wound bound up.

Lachrymal Gland. Tears are secreted by the lachrymal gland, seated above the eyeball on the side nearest the temple. A continuous or imperceptible tear-flow goes on night and day from the glands, through the ducts, over the surface of the pupil and eyeball, into the canals in the inner corner of the eye, and away into the nasal duct. This constant lachrymal flow gives the eye its limpid brightness and keeps it clear for its visual work.

Lactation is the secretion of milk in the mammary glands or the act of giving milk to the child. Should there be an absence or deficiency of the fluid, or the mammary glands remain inactive after parturition, sometimes the application of a poultice of castor oil leaves will promote lactation, and prevent fever or other trouble arising from "milk flying about the system." A deficiency of milk, however, is generally very difficult of remedy.

Lacteals. The lacteals open on the inner side of the intestines, and suck up the chyle, the milk-like fluid from which the blood is formed, conveying it to the thoracic duct. They rescue the nutritious properties of the food from the innutritious at the proper moment, and receive it for the replenishing of the system.

Lagophthalmia, commonly called "hare's eye," a disease in which the eye cannot be shut.

Laryngitis. Inflammatory affection of the larynx or organ of voice, generally resultant upon exposure to cold; but it may arise from erysipelas, tubercular ulceration, diphtheria, or intemperate habits. The symptoms of acute laryngitis are hoarseness, or complete loss of voice, a peculiar barking kind of cough, a choking feeling in the throat, pain and difficulty in swallowing, noisy and impeded breathing, scanty expectoration, and general feverishness. Unless these symptoms subside or are relieved the lips will become livid, the nostrils expand, and suffocation threaten. Delirium and coma will follow and collapse bring about death after oedema, or swelling of the glottis has occurred. Chronic laryngitis is not so violent in its symptoms, and the acute form may, after reaching a certain stage, become chronic. Acute laryngitis requires watchful medical care, the chronic variety may often be greatly relieved by the inhalations of soothing vapours, as that of pine, turpentine, or creosote. Tonics, especially muriatic acid, and suitable preparations of iron, may also do great good. Sometimes the affected parts are sponged by means of a probang, with bi-chloride of mercury, or dilute silver nitrate, a delicate operation that may afford in cases immediate relief.

Laryngotomy. (See *Bronchotomy*.)

Larynx. The upper part of the trachea or wind-pipe, the organ of voice containing the vocal cords. It

is a cartilaginous cavity, its upper opening being styled the glottis. Through the larynx or vestibule of the windpipe must pass the whole of the air drawn into the lungs by inspiration, and subsequently exhaled therefrom. It consists of the thyroid cartilage, the cricoides, the epiglottis, the arytenoides and the vocal bands, and altogether forms a beautiful and complex piece of machinery.

Lens. The crystalline lens of the eye lies behind the pupil. The shape of this transparent body and its position have the most important bearing upon the faculty of vision, and opacity produces cataract. Its use is to accommodate the eye to vision at different distances.

Leontiasis. An affection analogous to elephantiasis, but occurring in the face, and supposed to resemble the visage of a lion.

Leprosy. Is a very hideous disease, commencing with ulceration and thickening of the skin surfaces, attended by a febrile condition, and developing into incurable sores which gradually eat the flesh away and reduce the sufferer to a loathsome and inexpressibly wretched state. It occurs mainly under insalubrious conditions and in unhealthy climates, and it is a disease of hereditary character, by some reckoned contagious. Happily it is much less frequent than was formerly the case. It is scaly in the early stages of the eruption, and productive of intolerable itching.

Leucoe. A cutaneous disease of white patches on the skin, common in hot climates.

Leucoma, or albugo, a white opacity of the cornea of the eye.

Leucorrhoea. The "fluor albus" discharge in females, commonly called "the whites."

Leukemia, also Leucocytomia. A morbid condition of the blood characterised by a large increase of the white corpuscles, and a corresponding decrease of the red ones. It is consequent upon debility, and generous dietary, good sea air, and iron medicinally are requisite for its correction; the name of the disease is sufficiently descriptive. It signifies "white blood."

Ligaments. Dense white fibrous bands, resembling tendons, which hold the bones together at the joints. They are of various breadths, and sometimes so interwoven as to form a wide layer entirely surrounding the joint like a bag. Then they are called capsular ligaments and serve to prevent the escape of the synovial lubricating fluid.

Lightning. A person struck by lightning should have cold water dashed over him immediately after experiencing the shock. Sal volatile or brandy may be administered as a stimulant, and artificial respiration employed if necessary, as in drowning, or suffocation cases. Keep away from trees or the sides of a tall building in a thunderstorm; the open is safer.

Lignum Vitæ. The resin of this wood is used medicinally with some benefit in "cold" chronic rheumatism.

Lip. The colour of the lips arises from their being covered by an extremely vascular mucous membrane. In anemia they are pale; when the blood is insufficiently oxygenated, as in pneumonia, the lips become livid. They are liable to herpes or watery eruption, to fissure or cracking, and also to cancer, which see.

Lipoma. A soft fatty tumour.

Lithiasis. Stone or gravel in the kidneys or bladder.

Lithotomy. Cutting into the bladder for the extraction of calculi.

Lithotripsy. The operation of crushing stone in the bladder.

Liver. This is the largest of the glandular structures of the body and attains an average weight of between three and four pounds in the adult. It is easily thrown out of order by constipation or when anything interferes with the heart action. Alcoholic excesses work very great mischief in the liver, which is besides subject to many ailments such as enlargement, congestion, cirrhosis (or nutmeg liver), inflammation (of the substance or connective tissues), abscess, and atrophy, all of which require very careful medical treatment. Sluggishness of the liver, always a cause of trouble, may be indicated by a paucity of bile in the

faces and an excess thereof in the urine. When hæmorrhage occurs in acute atrophy, or wasting of the liver, death generally follows quickly.

Lochia. The discharge following parturition or childbirth.

Lockjaw. The popular name of tetanus, the severe spasm of which affects not the jaw alone, but all the muscular system more or less. It is due to the introduction through a wounded surface of a specific germ which acts violently upon the nervous organisation. Chloroform vapour and chloral are employed remedially, but this dreadful disease always requires the most prompt and careful medical treatment. The symptoms are almost identical with those of strychnine poisoning, and include crampy pain about the neck, jaw, and throat, twitching of the facial muscles, culminating in stiffening or cramping of all the body. Acute cases are usually beyond the reach of curative skill.

Loina. The lumbar region, that portion of the backbone between the upper edge of the haunch bone and sacrum, and the last dorsal or back vertebra. Lumbago attacks the muscles of this part.

Lumbago. A specific kind of muscular rheumatism attacking the lumbar or loins region. The excruciating pain of this often intractable malady often comes on quite suddenly. Local treatment will afford relief. Warm baths, and vigorous daily embrocation with camphor liniment, turpentine, and olive oil, or soap liniment in combination with opium are all palliative. Morphia injected subcutaneously will frequently overcome obstinate lumbago attacks.

Lumbar Region. The seat of lumbago, and in delicate children often of abscess. Abnormal sensations of pain in this part may often be symptomatic of fever, small-pox, influenza, or other inflammatory ailments.

Lumbrical. A muscle of the fingers and toes, worm-like in form, increasing the flexibility of the long flexors.

Lumbricous, better named the **Ascaris** or "**Round Worm.**" An intestinal worm, in some respects resembling the common earthworm in size, which may be removed by the administration of santonin in two to six grain doses in milk, preceded and followed by castor oil purgation.

Lunar Caustic. Nitrate of silver, a ready and popular cauterising agent, employed as a lotion in certain forms of ophthalmia, when it has antiseptic as well as caustic action. It is employed when what is known as "proud flesh" appears in the granulations of a wound, and in the destruction of corns and warts. It is prepared in little pencils or sticks by dissolving refined sugar in diluted nitric acid under gentle heat, the clear fluid being allowed to evaporate, leaving the crystallised nitrate behind. In epilepsy and St. Vitus's dance, it is sometimes administered internally, but must only be so employed under medical supervision.

Lungs. The organs of respiration, located in the thorax or chest. The left lung is slightly smaller than the right, and both may be described as bags or pockets of air cells. The bronchi, or divisions of the windpipe, branch from the foot of the windpipe into the lungs, which have the heart lying slightly obliquely between them. The spongy lung texture is lighter than water, and the two lungs together of an average healthy adult weigh about forty ounces. The air cells vary from a seventieth to a two-hundredth of an inch in diameter. The pulmonary artery carries the blood from the right side of the heart to be oxygenated, dividing into branches on entering the lungs, accompanying the bronchial tubes, and terminating in a network around the air cells. Here the pulmonary veins begin, which receive the purified blood and return it to the left side of the heart for circulation through the system. The diseases which chiefly affect the lungs are pneumonia, congestion, catarrh, pleurisy, bronchitis, asthma, and consumption, while gangrene and cancer in the organ are of less frequent occurrence. All these are dealt with elsewhere.

Lupus. A tubercular disease of the face and nose, very destructive to the tissues. It appears in red patches, which are slightly raised above the skin surface and give off an offensive odour. Without actually ulcerating, these patches often present points of great

irritation, but in very bad cases the tubercles both ulcerate and scar deeply. The X-rays and Finzen light rays are now used as a cure. Lupus is generally an inveterate disease so long as lowness of the system continues.

Lymph. A fluid of the body consisting of the fluid part of the blood, and carried within the lymphatic or absorbent vessels.

Malarial Fever. The febrile complaints so classed consist of intermittent fever or ague, remittent fever, and yellow fever. There are three forms of the former, the quotidian, the tertian, and the quartan, so distinguished according to the length of the intervals between the paroxysms. Remittent fever has many names, arising from the localities from which it originates or in which it is prevalent. Yellow fever is a peculiarly dangerous and markedly characteristic description of malarious disease, most met with in the islands of the West Indies, South America, and the African coast.

Malnutrition. Malnutrition is the condition in which the body is ill nourished and supplied with improper food and impure air. It is a condition often caused by or contributed to by criminal carelessness, but much oftener one of the "evils which are wrought by want of thought as well as want of heart," as Hood puts it. Children are the chief sufferers herein; happily, hygiene and the law are working together strenuously to stay the slaughter of the innocents and to circumvent the fell doings of the twin murder monsters, ignorance and avarice.

Maramus. Atrophy, wasting away from various causes.

Mastication. The chewing of the food, a very important preliminary to digestion, and very often insufficiently performed, to the detriment of the delinquent. If mastication be incomplete, more work than its share is thrust upon the stomach, and there is danger of indigestion and disorder. Mastication mutes the saliva of the mouth with the food, after the teeth have done their cutting and chewing or "champing" duty, and gives the food a good start on its digestive journey.

Mastitis. Inflammation of the mammae, or female breasts.

Maw-worm, a species of thread-worm lodging usually within a few inches of the end of the bowel. Repeated injections of salt and water will generally remove the pests. They are more troublesome to children than adults, and to girls than boys.

Maxilla. The jaw; the lower jaw is termed maxilla inferior, the upper maxilla superior; hence maxillary, pertaining to the jaw.

Measles. An eruptive fever, contagious, chiefly affecting children, and rarely occurring to any person more than once in a lifetime. The eruption appears on the fourth day and ceases on the third subsequent day by desquamation. Measles require fourteen days from the inoculation to attain maximum intensity; that is eleven days will elapse after contact with the poison germ before the characteristic "spots" appear. The first symptoms are catarrhal, sneezing and running of the nose, watering of the eyes, with a short hard kind of cough. Febrile conditions follow, a quickening pulse, accompanying increased temperature, and perhaps alternate shivering, headache and loss of appetite. On the third or fourth day after the illness has been marked, the mottled rash shows on the face, wrists, ankles, neck, chest and body generally. It consists of distinct reddish-purple "spots" slightly raised above the skin surface, the eruptions in groups, often with a crescentic or horse-shoe kind of arrangement. The eruption subsides in three days or so, and has generally all gone by the end of a week leaving the skin slightly rough. As the cuticle peels the patient should be bathed in suitable disinfectant solution daily. Nursing, warmth and low diet, with particular attention to the bowels, constitute the essential treatment of measles.

Megrim or Migraine. "The Megrims" is a neuralgic pain in the side of the head, of a peculiar character, periodical, and induced by stomachic disorder. It is generally confined to one side of the head, and chiefly affects the temporal nerve, being

accompanied by giddiness. Constipation, causing sluggish liver, with the general health low, are the conditions usually antecedent to megrim. Two grains of caffeine combined with eight of phenacetin, will generally, if repeated at intervals of four hours, relieve this painful affection better than quinine.

Melobion's Glands.—Small glands between the conjunctiva of the eye and the cartilage of the eyelid.

Melanosis. A malignant disease, characterised by the production of black or brown matter on various external parts of the body. Melas, a variety of this malady is endemic mostly in Arabia.

Membrane. A thin flexible substance investing many internal portions of the body; also occurring externally as on the eye and ear. The mucous membrane lines the alimentary and air passages, the serous membrane spreads over the joints and abdominal and thoracic cavities, and so on; while the epidermis or cuticle is the membrane forming the outer layer of the skin.

Meningitis. Inflammation of the covering membranes of the brain and spinal cord. It may be caused by injury to the skull, blood-poisoning or sunstroke, and is frequently fatal.

Menstrual. Pertaining to the menses, or monthly female flow during the periods of puberty.

Menthol. A volatile gum which remains after the distillation of the essential oil of peppermint. It is possessed of anæsthetic properties, and has the power of producing temporary nervous paralysis on application and is thus beneficially employed in the palliation of neuralgic pain.

Mephitis. Vapours, gases and exhalations, which are not merely offensive but often noxious and destructive. Frequently they are the outcome and evidence of decomposition. Carbonic acid gas, the fatal "choke-damp" of ill-ventilated mines, is a characteristic exhalation of this poisonous character, and has been appropriately termed "mephitic gas."

Mercury. The metal quicksilver, very largely used in medication. Mercurials, as blue pill, calomel, etc., largely does increase the secretions, especially that of bile, and favour the absorption of morbid products, or promote their elimination from the body. They are valuable, skilfully applied, in inflammations, congestions, rheumatism, and dropsies.

Mesentery. The broad fold of peritoneum, or lining membrane of the cavity of the stomach, attached to the vertebrae of the loins, enclosing and sustaining the smaller bowel. It contains many important blood vessels and numerous glands. The mesentery is subject to disease a great deal in childhood. Children "out of sorts" with furry tongue, unpleasant breath, and disordered bowels, will sometimes lose flesh rapidly and unaccountably, the appetite remaining unimpaired. The abdomen will enlarge, though the arms and legs waste and the features sink. This is a strumous condition brought about by mesenteric trouble and will, unless overcome, very likely develop dangerous diarrhoea and convulsions, and end in exhaustion. The glands of the intestines must be restored to a healthy state by constitutional treatment before any marked improvement can occur.

Metacarpus. The portion of the hand extending from the wrist to the fingers.

Metastasis. The shifting of a disease from one part of the person to another. In mumps the disease often shifts from the mouth to the female breasts or male testicles.

Metatarsus. The middle of the foot, between the toes and the ankle.

Miasma. The unhealthy effluvia or exhalation which occurs in hot and swampy countries, and strikes down with ague or other dangerous disease those unacclimated.

Microbe. A term analogous in meaning to that of "germ," an organism infinitesimally small, but instinct with life and the power of multiplication in the human system. Germ, bacteria, bacillus, microbe, micro-organism, are all practically synonymous. (See Germ.)

Micturition. The passing of water from the bladder.

Middle Ear. The middle ear is an ear cavity between the external and internal ear or labyrinth, and comprises the Eustachian tube, which connects it with the upper part of the throat, and the mastoid portion of the temporal bone. It is the seat of most of the diseases of the organ of hearing, the complicated drum cavity being particularly liable to become disordered.

Milk. The mammary secretion of female mammals, naturally designed as the first food of their young. It suffices for all the alimentary requirements of infancy, and is capable of sustaining adult life for an indefinite period to an extent exceeding that compensable by any other known food substance. The milk of the cow can scarcely be over-rated as a nutritious article of dietary, its digestiveness being also a great recommendation. This is increased by the addition of a proper proportion of water, by judicious culinary preparation, and by the introduction of a little salt. A feverish patient to whom solid food would be most harmful will obtain sustenance from the iced milk with which his thirst is assuaged, enabling him to tide over the crisis.

Milk Fever. This very troublesome affection, which occurs only at a period a little subsequent to childbirth, has more to do with a febrile condition induced by absorption of fed matter into the blood than it has with any lacticiferous disturbance, though it may of course occasion the latter. It should be regarded as a light form of puerperal fever, and treated accordingly. Simultaneously every endeavour should be made to establish the secretion and flow of the milk, emptying the breasts as frequently and thoroughly as possible. With the subsidence of febrile symptoms the painfully distended mammary glands will regain normality. Iced lemonade sparingly given will have salutary effect when the thirst of the patient is intense.

Miscarriage occurs sometimes without warning, though it is commonly preceded by slight pains in the back and abdomen, with an unexpected discharge, and considerable hemorrhage, continuing for several days. Rest is requisite, and very careful medical treatment, or the foundation of much future mischief may be laid.

Mole. A permanent coloured spot, or a small polypus, on the skin. The first is occasioned by pigmentary deposition, and either may be more or less unsightly, if it occur upon the face or neck. It is not always safe to have a mole removed, as cancerous disease may develop upon its site. They may be ligatured away without danger in cases, or eradicated by painting with iodine.

Monkhood. The common plant from which the poisonous drug aconite, much employed in the treatment of neuralgia, rheumatism, and dropsy, is obtained.

Morphia. A very powerful and exceedingly useful alkaloid anodyne, obtained from opium. For certain particularly painful ailments it is given by the mouth in doses of one-eighth to a quarter of a grain; it is administered by the bowel in the form of a suppository in quarter to half grain doses; and it is hypodermically injected in doses commencing with the sixth of a grain strength, and increased to a quarter of a grain when pain is persistently severe.

Mortification is a term usually employed to signify that death has taken place in some one part of the body only. The appearance of mortification in any member is blackening of the dead part, which is separated from the still vital tissue by a bright red line of demarcation. An offensive odour is exhaled from the dead tissue. When mortification is present there is great prostration, and the case calls for prompt surgical interference.

Mucous Glands. These are minute bags formed by a delicate and peculiar membrane, opened by microscopic ducts, through which they discharge their lubricating contents over the tongue, windpipe, stomach, intestines, nose, bladder, etc.

Mucous Membrane. A smooth and tender covering of the internal organs generally, secreting the glutinous mucus which forms its protection. When the mucus is excessive, we have the catarrhal condition. The mucous membrane is soft and velvet like,

pale pink in health, and deep red on inflammation. It never forms adhesions, but may be the subject of extensive hæmorrhage.

Mucus. The viscid secretion thrown out over the mucous membrane. It is composed of numerous globular cells floating in fluid, and increasing in quantity upon irritation up to a point, but becoming paralyzed upon extensive disturbance. Thereupon the flow of mucus ceases, and the membranes are parched and painful. Excess of mucus, caused by cold or otherwise, creates phlegm, and coughing is set up to get rid of the accumulated matter.

Mulberry Calculus. A urinary concretion of oxalate of lime, fancifully considered to resemble the mulberry in form.

Mumps. A kind of quinsy caused by swelling of the parotid and other salivary glands of the neck, and accompanied by feverishness and pain, especially on the opening of the mouth and in swallowing. The malady is usually confined to one side of the face, but may attack both sides simultaneously, and occasion much inconvenience and temporary deformity. Mumps are highly contagious, and frequently epidemic amongst school children. Hot fomentations will afford relief, and in severe cases the application of leeches may be desirable.

Muscles. Such parts of the fleshy portion of the body as cause motion, bend, relax, contract, and otherwise affect activity. They correspond to what we term the "lean" of meat. Voluntary muscles are those subject to the will, as of the face and limbs; involuntary those whose action is continuous, and not necessarily subject to volition, as of the heart, stomach, etc. The controllable muscles are stimulated into activity by the spinal nerves, acting at the instance of the brain.

Myolampus. Throbbing of the muscles.

Myopia. Short sight, the eye being half shut and continually winking.

Myriæa. A disorder of the eye, attended with contraction or too-small perforation of the pupil.

Mole. The Latin name for "Mole" (which see), a vascular skin discoloration or tumour, found on a child at birth, and frequently styled "Mother's mark," because of the popular idea that it is due to some maternal impression during the period of gestation. Sometimes it is slight and superficial, but occasionally large and prominent. It is composed of a network of enlarged blood-vessels of the skin or subcutaneous cellular tissue, and may include arteries as well as veins. It has frequently a strawberry-like appearance, and should it occur upon the face and head is apt to be very unsightly. If it assume the importance of an aneurism it will be difficult to remove.

Nails of the fingers and toes are really hardened and thickened prolongations of the outer layer of the skin, or cuticle, and are composed of flattened cells compressed into horny matter. They rest upon the nail beds as the scarf skin lies on the true skin or derma, and resemble the hair as to composition and in the matter of growth.

Naphtha. A distillate of coal and wood-tar occasionally employed medicinally as an external application, for its stimulating effects.

Narcosis. The condition induced by the administration of any anodyne or sleep-promoting agent.

Narcotics. Certain medicines, variant in their mode of action; which have a common tendency either to produce sleep or allay pain. The latter are classed as anodynes, the former as soporifics. They should be taken always with caution and never without sufficient cause, lest their use become habitual and harmful.

Nares. The nostrils.

Nasitis. Inflammation of the nostrils or nares.

Natrum, or Natron. Soda, an alkali, the oxide of sodium, analogous to potash, and obtained from common salt or from certain marine plants and sea-weeds. The salts of natrum are very much used medicinally, carbonate of soda being familiar to all. "Glauber's Salts" is the sulphate of natrum, while natrum nitricum or chloride of sodium, is the common salt of the dinner-table, an absolute essential of healthy life.

Nausea. The feeling of sickness or disposition to vomit, without being able to obtain the relief of its accomplishment. This disagreeable sensation is an indication of disturbance of the nervous or digestive system, or both, and frequently a presage of approaching illness, or an accompaniment of disease. Nausea needs treatment in accordance with its cause.

Navicular. A term applied to the bones of the wrist and ankle, because of their supposed resemblance to the shape of a ship.

Neck. That part of the body connecting the trunk with the head. It is the channel of communication between the nervous system generally and its headquarters the brain; the carotid arteries, supplying the brain with blood, run through it, and the important veins conveying the blood back from the head to the heart traverse it. Within the neck also are the wind-pipe, the œsophagus, and the thyroid gland; also the parotid and submaxillary glands, which secrete the saliva. All these important organs and vessels are subject to ailments which are severally dealt with elsewhere.

Necrosis. Inflammation of, or injury to bony matter, ending in decay and "decay" of the bone. This serious condition is usually found in the bones of the thigh and leg; but sometimes occurs in the jaws of workers in match factories, as the result of inhaling phosphorus fumes. The dead or necrosed portion is frequently encompassed by a case of new bone, which has to be penetrated before the decayed part can be removed. There is swelling of the bone in necrosis, and the appearance of peculiar little apertures called *cloacæ* communicating with the diseased bone and discharging purulent matter. The only thing to do with a necrosed bone is to excise it surgically.

Nerves are the delicate organs which represent the telegraph wires of the body. They convey the will of the brain to all the muscles, and convey to the brain every sensation from the body. They are, as it were, the telegraph wires conveying messages to and fro between the brain and spinal cord and every part of the body, and present the appearance of flattened cords of variant size, uniting at times to form a network or "plexus." The great masses of nerve cells and nerve fibres are divided into the brain or cerebrum, and the ganglia of the special senses, all situate within the skull; the spinal cord or marrow in continuation of the medulla oblongata; the cerebrospinal nerves, which are distributed to the muscles, the skin, and all the organs of sense; and the sympathetic nerves which proceed from the ganglia, or nerve centres, to the blood vessels and viscera, and are called the nerves of organic life. The sensitive nerves are called afferent, because they carry impressions to the nerve centres and thence to the brain; while the motor nerves are known as efferent on account of their office of conveying impressions from the brain, exciting or suspending muscular action, or influencing secretion and nutrition.

Nerves, Names of the. Cerebral nerves are those arising from the brain: nine pairs in all. The olfactory nerves expand upon the membrane of the nose; the optic nerves terminate in the retina; the motor oculorum are distributed to the muscles of the eye; the pathetic, or trochlear, to the superior oblique eye muscle; the trifacial, or trigeminal, from the grand sensitive nerve of the head and face; the abducentes are distributed to the external rectus muscle of the eye; the portio mollis and portio dura are the auditory and facial (or nerve of motion and expression) nerves respectively; the grand respiratory nerves comprise the glosso-pharyngeal and vagus, as well as the spinal accessory; and the last pair are the lingual nerves of the tongue, called also the gustatory nerves. Thirty-one pairs of spinal nerves radiate from the spinal cord and supply the body at large. From all these, other nerves, too numerous to particularise, extend.

Nervous Ailments. This term, or its corollary "nervous affections," comprehends a host of complaints of a nondescript character, though there are many important diseases in which the disorder plays a prominent part, such as neuralgia, paralysis, insanity, hydrophobia, and lockjaw, to all of which attention is

paid in their proper order in this section of the Cyclopaedia.

Nervous Disease, properly so-called, is always associated with some local mischief which impoverishes the nervous system by draining away its force, either by constant irritation or pain. Females, whose special organs are supplied with a sensitive and complicated nervous apparatus, are more liable to nervous disease than males; hence hysteria is preponderant in the softer sex. The proper method of dealing with nervous disorder of any kind is to search for, and, if possible, remove the cause.

"Nettle Rash" is a very irritating affection of the skin, characterised by the appearance of a number of solid little "bumps" or wheals, pale in the centre and reddish towards the margin. They tingle painfully and bear considerable resemblance to the eruption consequent upon contact with stinging nettles. The rash is generally a symptom of indigestion, and may be caused by partaking freely of shellfish or nuts. In that case the administration of an emetic, followed by a purgative, will probably soon set things right, though special care must be exercised as to dietary for some time. Goulard water or some other cooling lotion may be applied to the troublesome eruption, after taking a warm bath with soda dissolved in it, with immediate advantage. Dilute carbolic acid combined with eau de cologne will also be found of soothing influence if applied to the affected part.

Neuralgia, wherever occurring, is an exceedingly painful affection, recurring paroxysmally. It is of most frequent occurrence in the nerves of the face and receives the name of "tic" or "tic-doloureux"; and the sciatic nerve of the leg is often also the seat of neuralgia. It is, when in connection with the nerves of the face, very frequently caused by a decayed tooth or some other local irritation. If there be a faulty tooth, that must be removed before the neuralgia can be got rid of, and it should never be inferred that the tooth is sound because decay is not discernible.

Neurine. The substance of the nerves; neurotic signifies relating to the nerves; neurotony, dissection of a nerve; neuroma, a tumour found on a nerve trunk or ganglion; neuron, a nerve cell.

Neuritis. Inflammation of the nerves; neuro-linitis is the technical name for inflammation of the sheath of the nerves, or neurilemma.

Nictation. Winking; the condition of involuntary winking is technically termed "nystagmus."

Nightmare. Nightmare, sometimes called "Incubus," is a very distressing accompaniment of disturbed sleep, consequent upon constipation or indigestion. Generally the disagreeable experience can be directly traced to digestive derangement in the shape of a heavy supper of unwholesome food, and in bad cases the horrible dreams it brings may be aggravated into somnambulism. Let the bowels be kept in order and the dietary be regulated as to constituents and meal-times, and there will be little nightmare.

Nipple. The protuberance of the breast, whence is drawn the maternal milk. It is a conical eminence, rose-tinted and in virgins surrounded by an areola or circle of a pink colour, which becomes brownish in those who have suckled.

Nitrates used in medicine include saltpetre, the nitrate of potash, nitrate of silver or lunar caustic, and the subnitrate of bismuth.

Nitre. A very valuable medicine, in the form of the purified and sweetened spirit, as a cooler of the blood. In feverish cold it is safe and beneficial, and it makes an alleviative lotion for inflamed rheumatic joints.

Nitric Acid. An acid composed of five equivalents of oxygen to one of nitrogen, forming nitrates, some of which are employed medicinally, while the acid itself is of very considerable tonic value. Employed in the arts as aquafortis it is one of the most powerful acids known and will dissolve nearly all metals.

Nitro-Glycerine. An oily liquid, heavier than and almost insoluble in water, obtained by treating glycerine with nitric and sulphuric acids, the nitrate of the oxide of glycol finds a limited employment in medicine.

Nitro-Hydrochloric Acid. This is utilised as a tonic internally in liver complaints, besides being frequently sprinkled over hot fomentations applied to the region of the liver externally when there is sluggish action of that organ.

Node. A hard circumscribed tumour, proceeding from inflammatory swelling of the periosteum of the bone, frequently the result of rheumatism. The bones of the skull and the shin are the most common seats of nodes, but any bone may be affected. Absolute rest should be enjoined when the disease is at its acute and painful stage, and fomentations or poultices may be employed remedially, or leeches applied. Iodide of potassium may be administered internally, or mercury tried, but medical attention will be necessary.

Nodosity. Any concretion, but especially calcareous, as present in the fingers in gout.

Noises in the Ear are very frequently due to diseases of the organ, or may arise from aggregations of wax in the passages, or from the use of certain medicines, such as salicine and quinine. (See Ear.)

Noli me tangere. A species of lupus or herpes, attacking the cartilage and skin of the nose.

Noma. An ulcer attacking the cheek, or other parts in young females, sometimes called "water canker."

Normal. According to rule, the natural condition.

Nose. The organ of smell, so placed above the mouth that the odour of whatever is placed therein must be immediately perceived, is lined by a vascular mucous membrane, largely provided with cilia or minute hairs, which filter the air on its passage to the lungs. It is frequently the seat of catarrh, or cold in the head, when the mucous membrane secretes mucous abnormally, causing difficulty in breathing, and other inconvenience.

Nostrils. The external openings or apertures of the nose, formed by two thin cartilaginous plates curved in such a manner as to form the inner and outer walls of each opening. The cartilages are expansive, and offer a wide extent of covering membrane upon which the nerves of smell are distributed to the action of air bearing odoriferous particles.

Nubecula. A disease of the eye producing a sensation of misty surroundings.

Nucleus. A point around which "matter" or some substance gathers in disease. The particle in the inside of a living cell.

Numbness may proceed from temporary suspension of nervous action, occasioned by long-continued pressure in one direction, from standing in water or on a damp spot, or from exposure to cold or draught. Warmth, friction, or the hot bath are palliative or corrective, and friction with the hand often suffices to restore circulation; but when more enervating measures are called for, turpentine or oil, with or without mustard, will usually answer the purpose. Numbness accompanied by loss of the power of motion points to paralysis.

Nux Vomica. The nut of the East Indian Kocchia-tree, from which is obtained the poisonous strychnia and the alkaloid brucine, both useful medicinally. Nux vomica, in tincture and extract, is employed advantageously in atonic conditions of the stomach, intestines, and general system; and strychnine may sometimes be injected subcutaneously with success in minute proportions when there is heart failure. In nux vomica poisoning, chloroform inhalation will often afford relief, and annuus chorcal acts as an antidote.

Nyctalopia. Day blindness, the faculty of seeing best at dusk or dark, attended by defect of vision during daylight.

Obstruction. A term used by doctors to describe a condition in which there is some impediment to the free passage of an excretion or secretion. Thus gall-stones, preventing the passage of the bile, in its usual course, are obstructions, as are calculi lodged in the ureter, bladder, or urethra, and stopping the urinary flow. Swallowed plum or cherry stones may obstruct the bowels, as may hardened faeces, and inflammation sometimes also occasions obstruction, as in enteritis. Twisting of the gut, or invagination, may set up the condition, or the pressure of tumours, or we have

embolic, or blood clot in the brain or important arteries.

Occiput. The occipital bone, forming the back part and base of the skull, containing an oval aperture through which passes the spinal cord, the spinal accessory nerve, and the vertebral arteries.

Œdema. The dropsical swelling or tumour, due to the effusion of the watery constituent of the blood into the subcutaneous tissue. The condition may be due to disease of the heart, liver, or kidneys, or it may arise from pressure in the pelvis, preventing the due return of the venous blood. Œdema is generally a grave symptom.

Œdematous. Dropsical.

Œsophagus. The gullet, or canal leading from the pharynx to the upper opening of the stomach. Œsophagitis signifies inflammation of this important passage. Food is conveyed through the "meat-pipe" by muscular and wave-like movements, and does not drop down mechanically after swallowing. The Œsophagus is about nine inches long in the average adult.

Oil, Camphorated. This is a soothing application in chest colds and glandular swellings of the neck. It should be warmed by placing the bottle in hot water, and then rubbed gently into the part by the hand.

Oils are very much used in medicine. Some are soluble, as turpentine, oil of juniper, lavender, mint, or lemon; others fixed, like linseed, croton, almond, olive, castor, cajuput, and cod-liver oils. They are all, more or less, of an aperient character, and many of them may be employed externally as accessories to stimulant preparations, and for emollient purposes. They are referred to separately in their alphabetical order, and in connection with the ailments for the relief of which they are called into request.

Olfactory Nerves. These nerves, issuing from the brain, supply the mucous membrane of the nose, and confer the sense of smell. They are formed of grey matter.

Olibanum. A gum resin, formerly much used for medicinal purposes.

Omentum. A membrane of the stomach, covering the intestines. (See **Mesentery**.)

Omphalocele. Rupture of the navel.

Onychia. A painful disease which sometimes affects the root or side of the nail, resulting in ulceration or the formation of an abscess. Powdered nitrate of lead dusted over the affected surface will sometimes afford immediate relief; but if the ailment be persistent, poulticing and hot fomentation should be resorted to, with lancing if necessary for the liberation of pus. It may be necessary to remove the nail, which can be accomplished painlessly under local anaesthesia by cocaine.

Ophthalmia. Inflammation of the outer covering of the eye, occurring for the most part amongst scrofulous children. Newly born infants are particularly liable to be attacked by this painful ailment, which also frequently assumes an epidemic character amongst school children. Ophthalmia usually commences with pain or oppression across the forehead, a pricking sensation, with heat and dryness, in the eye, giving the feeling of grit or sand between the ball and lid. There is great and increasing intolerance of light, and the inside of the eyelids become swollen and blood-charged, while the white of the eye appears bloodshot, with here and there dark purplish spots where the blood in the capillaries has become effused. Exudation after a time covers the eye with a film of muco-purulent stringy looking matter, obstructing the vision, and occasioning almost unbearable irritation and pain. Relief may be obtained by the introduction of a five to ten per cent. solution of cocaine into the eye. Later a lotion may be applied—a few drops at a time—every two or three hours composed of five grains sulphate of zinc, one drachm of quinquina wine, and rose water to make one ounce. Salicine may be taken internally simultaneously in ten grain doses every two hours or two grains of quinine every four hours. But ophthalmia is a disease which requires skillful handling, so that competent medical advice should always be obtained.

Opium. The thickened juice of the unripe capsules of the common poppy, which, when dried, becomes of a dark brown colour. Opium, in its various medicinal forms, has probably relieved more human suffering than any other remedial agent.

Opium Plaster. This is prepared from finely powdered opium and resin, the proportion of opium being not more than one in ten.

Opodeldoo is the old soap liniment, now largely superseded by the soap and opium liniment, of the Pharmacopœia. It did good service in the treatment of bruises and sprains in its day, and was made up of hard soap two and a half ounces, camphor one and a quarter ounces, rectified spirit eighteen ounces, oil of rosemary three fluid drachms, and distilled water two ounces, all well shaken together and thoroughly amalgamated.

Optical Illusions are frequently occasioned by a disordered condition of the nervous system. They are indicative of brain disturbance. Also optical illusions occur in delirium, caused by alcoholic excesses, fever, or injury. They are the outward sign of inward mischief, which needs very serious attention.

Orthopnea. An affection of the lungs, in which respiration is greatly impeded unless the patient remains in an upright position.

Ossification. When used to indicate a diseased state the unnatural formation of bone is what is usually implied by the use of this term. The abnormal condition occurs at times in the soft textures of the arteries, and chiefly in the great aorta where it rises from the heart. Ossification in any important artery generally leads to aneurism, rupture, and sudden death. Its exact cause and progression are obscure, but doubtless it arises from morbid degeneration. Ordinary ossification means bone-formation.

Ostealgia. Pain in the bones; ostealgitis, inflammation of the bony structure.

Otalgia. Ear-ache; otorrhagia, a discharge from the ear. In this distressing condition the filling of the ear with glycerine or tannic acid, the sufferer being laid on the side, will often afford relief.

Otitis. Inflammation of the inner ear.

Ovariectomy. The operation for removal of tumours of cysts formed in connection with the ovaries of women, now carried out with almost unvarying success by experienced surgeons, whereas only a few years ago it was rarely attempted, because of the fatalities which followed before anaesthetic and antiseptic practice had made such wonderful strides.

Oxalic Acid is a vegetable acid, found in rhubarb, sorrel, and other plants, poisonous, but of limited use in medicine. Calx is the best antidote, or magnesia may be tried, but no time must be lost in their administration.

Oxide of Bismuth, in six to ten grain doses, taken three times a day, about half an hour before meals, forms a corrective of heartburn and acid dyspepsia.

Oxygen. The vital gas of the air, essential to the existence of animal and vegetable life. It is by the inhalation of oxygen that the blood is purified on the lungs. It can be chemically prepared, and has of late years been largely employed in the treatment of pneumonia and other diseases which interfere with the necessary natural oxygenation of the blood.

Oxymel, a mixture of vinegar and honey, was formerly a good deal employed in the making of cough medicines, but spirit of squills has largely supplanted it. The oxymel of squills is prepared by amalgamating five ounces of squill vinegar with half a pound of honey.

Oxyopia. Extreme short-sightedness, preternatural sensibility of the retina.

Oxyphonia. An abnormal shrillness in the tone of the voice.

Ozena. An ailment of the nose, discharging fetid matter, and sometimes occasioning caries of the bones.

Ozone. A dense elemental substance of penetrating odour, supposed to be generated in the atmosphere by electrical agency, and forming the peroxide of oxygen. It is used medically as a deodorizing and antiseptic application where suppuration exists in deep-seated cavities. Naturally ozone is found in the air at

the seaside much more abundantly than in the neighbourhood of thickly populated inland towns.

Pachyphollia. A disease due to thickening of the bile.

Painter's Colic, so called, is an affection of a very serious character, attributable to the absorption into the system of lead from the paint employed in his daily work. The symptoms are cramping pain in the stomach and abdomen, accompanied by continuous constipation, with a blue line round the gums. At a more advanced stage "Painter's Paralysis" with "drop wrist" may occur; pointing to the necessity of a drastic course of treatment. (See "Colic.")

Palate. The palate, or roof of the mouth, is formed in two portions, together making the partition separating the mouth cavity from that of the nose. The hard palate, in front, consists of a bony plate covered by a dense tissue called the periosteum; and the soft palate, or velum, behind, terminates in a central pendulous structure, the uvula. The soft palate is a movable fold of mucous membrane, inclusive of muscular fibres. It assists the articulation of sound materially, and has its part in preventing the passage of food into the posterior nose opening above.

Palpitation of the heart may be occasioned by functional disturbance of the stomach, as in flatulence, or it may arise from over-exertion or excitement, or be directly due to organic disease of a more or less serious character. If a flatulent condition be answerable for the ailment brisk aperient should be administered, while mustard or turpentine plasters applied over the stomachic region will often afford immediate relief. A suitable internal remedy is furnished by a mixture of bicarbonate of soda one scruple, sal volatile half a drachm, peppermint water one ounce, and tincture of capsicum five drops; to be taken at intervals of three hours.

Palsy. A disease characterised by absence of power to regulate the muscles of any part, or the deprivation of feeling, practically synonymous with **Paralysis**, which see.

Pancreas. The Sweetbread, a narrow gland lying across the spine in the upper part of the abdominal cavity, directly behind the stomach. It secretes the pancreatic juice, a fluid resembling the saliva; and its duct enters the bowel at the opening which carries the bile from the liver. The two fluids thus introduced combine to convert the chyme into chyle. The pancreas weighs three to four ounces, and in shape somewhat resembles the tongue of the dog. It reaches a length of from six to eight inches in an adult, and is about an inch and a half wide, and from half an inch to an inch thick. The pancreas of man is analogous to the sweetbread in animals, and the effect of the action of its emulsifying juice is to complete the change of the partially digested starchy food constituents into sugar, a transformation which the stomach has no power to accomplish. Its juice also digests nitrogenous foods and fats. It is the only digestive fluid acting on all kinds of food.

Pannus. A disease of the eye, in which the cornea is obscured by a fleshy and webby covering.

Papilla. Is the name applied to small superficial eminences of the skin and mucous membrane, occurring on the tongue and elsewhere. These minute elevations are exceedingly numerous, and as many as four hundred occur on a surface measuring only a twelfth of an inch square in the papillary layer of the corium. The nipple of the breast is also styled the papilla.

Papules, are pimples erupted upon the skin by disordered or diseased small-pox, chicken-pox, acné, impetigo, herpes, boils, and carbuncles, all commence as papule.

Paralysis. A loss of sensation, motive power, and sometimes of intellect. The nervous system has been disarranged locally and generally, by shock, disease, or injury. Occasionally the effect of paralysis may be obliteration of sensation without interference of motive power, while loss of muscular control may arise whilst sensation continues intact or only slightly affected. The body may be paralysed vertically, from head to foot, on one side only;

that is to say the affected half of the body may be deprived of muscular power or feeling, one or both. The side of the brain which is affected is the opposite to that which is paralysed in the body. When a paralytic seizure is experienced on the right side, there is very often a consequent defect in articulation, or the power of speech, in which the sufferer makes a rambling use of words inappropriate to the expression of his meaning due to the fact that the active speech centre is on the left side of the brain. Palsy again may affect the body transversely, taking away the power of the trunk, and limbs below a certain point. Much local paralysis is that which seizes but one hand, one foot, or one side of the face; or the tongue and palate may be deprived of feeling or motion without depreciation of the muscular or sensitive power elsewhere. The bladder or the rectum alone may be paralysed in other cases, occasioning involuntary evacuation, or the wrist muscles only, as in a phase of lead poisoning or "painter's colic." Apoplexy is the most frequent cause of paralysis, but it may be due to many other disorders such as compression of the brain substance or spinal marrow, tumours, interference with the nervous system or impaired nervous energy generally, continuous exertion, violent emotion, exposure, rheumatism, poisoning and accident. Also paralysis may be the result of decay and debility.

Paralysis, Infantile. Paralysis in children, usually partial, often originates in some region of the body distinct and distant from the part affected; and may, in fact, be due to sympathetic nervous irritation of an extensive character. Such irritation is frequently traceable to bowel trouble, either the effect of indigestion, constipation, or the presence of intestinal worms.

Paraphora. A technical term for delirium.

Paraphrenitis. An inflammatory condition of the paracortex or midbrain.

Paraplegia is complete paralysis of the body, and when seen in the lower portion, almost invariably arising from injury to or disease of the spinal cord or its membrane. (See **Paralysis**.)

Parasites. Intestinal worms are a frequent cause of troublesome irritation in children, and should be treated with suitable vermifuges as elsewhere advised. Fungus or "mould" of a vegetable nature may be conveyed to the healthy from the diseased by contact, such as the touching or wearing of clothing, using towels, brushes, or razors, or sitting on seats previously occupied by those affected. Hence scaldhead, "ringworm," barber's rash, etc., are often spread; hence also lice and other objectionable parasites find new quarters.

Parastoma. Convulsive distortion of the mouth.

Parenchyma. The spongy substance contained between the blood-vessels of the viscera.

Parietes. The walls or sides of any anatomical cavity. The parietal bones of the skull are situated in its sides, and form part of the cranial walls.

Pariethitis. Inflammation of the tonsils.

Parotid Gland. The large salivary gland situated in front of the ear. This, with its excretory duct, is frequently the seat of disease, particularly "the mumps" (which see). Here, too, "tubercular disease" is often made manifest by painful abscesses, leaving ugly scars behind them.

Partial Baldness. (See **Alopecia**.)

Patella, the knee-pan, or cap of the knee. It protects the front of the joint, and increases the power of the muscles which extend the legs.

Pedicular. A genus of parasitic insects, including the common louse. Ticks or lice are usually the outcome of negligence, and frequently indicate debility or the exhibition of a congenital ground for the existence of the pests of the dirty and unhealthy. They inhabit the hair and skin, and may occasionally transfer themselves to cleanly children and others, when they are given short shrift. Vinegar and water will destroy the ova of any of these parasites, and mercurial ointment poison the fully developed pest.

Pelvis, or haunch, is the irregular bony framework which supports the spine, open above and below, and forming the lower boundary of the abdominal cavity.

Its upper diameters are greater in the female anatomy than that of the male.

Pepsin. "Pepic" means promoting digestion, and pepsin is the active principle of the gastric juice, the digestive fluid of the stomach. The pepsin employed in various medicines is procured by the mucous membrane of the stomach of the pig or some other animal with a blunt knife, rapidly drying under heat the pulpy substance obtained, powdering it, and placing it in a well-stoppered bottle. Pepsin is serviceable in all ailments occasioned by want of tone and deficiency in secretion of the gastric juice.

Pericardium. The membranous sac enclosing the heart and its appendages. Its inner surface, resembling in structure the synovial membrane of the joints, secretes a similar lubricating fluid.

Perichondrium. The thin inner lining membrane of the bones of the skull, very firm and tough in texture, and closely attached, analogous to the periosteum in other parts of the body.

Perinæum. The region between the anus and the generative organs.

Periosteum. The adherent membrane enveloping the bones of the body, except at the points where cartilage exists in the joints. In the periosteum (as in the pericranium of the skull) ramify the blood-vessels which afford nourishment to the bones; and upon its laceration or serious injury otherwise there is a liability to necrosis or "death of the bone." An inflammatory condition of this membrane is styled periostitis. The periosteum is subject to rheumatic ailments. It is on the periosteum that bone-formation and bone repair devolve.

Peristaltic. Worm-like or spiral; applied to the wavy motion of the intestines, caused by the contraction of their fibres for the assistance of digestion and evacuation.

Pertoneum. The thin, smooth serous membrane which invests the entire internal surface of the abdomen and covers the viscera. It is of great strength, and whilst permitting perfect freedom to the organs it encloses, is a powerful auxiliary to their retention in the natural position. When dropsical effusion ensues from diseases of the heart, kidneys, or liver, the fluid exudes from this extensive membrane, which is also, in all its parts, liable to inflammation. The peritoneum has to be cut open when surgical interference with the organs within is requisite, an operation now carried on with impunity in anæsthetic and antiseptic practice. Peritonitis, inflammation of the peritoneum, is always a perilous condition.

Perityphilitis is a local inflammation of the peritoneum, usually originating in disease of the vermiform appendix.

Pernanganate. A salt of permanganic acid, the highest oxidised condition of the metal manganese. In solution it is mildly antiseptic and disinfectant, and permanganate of potash is largely used for both purposes, besides being prescribed in pills for the acceleration of tardy menstruation.

Perspiration. The natural excretion of the skin; the passing out of which through the pores produces radiation and maintains the body at its normal standard.

Pharynx. The musculo-membranous sac, measuring about four inches in length, lying behind the mouth and soft palate, and continuous below with the gullet. It is loosely attached to the spinal col. upon which it can be moved. Communicating with the pharynx are the openings for the nostrils, the eustachian tubes from the ears and the larynx; and thus it is that when there is inflammation or catarrh of this part, there may be consequent deafness, loss of voice, or nasal obstruction.

Phlebitis. Inflammation of the veins, recognised by a painful corded feeling and swelling. The disorder may be the result of blood-poisoning, but is most frequently present after parturition, when it gives rise to "white leg," so called because of the tense and glossy appearance of the puffed-up limb.

Phlebotomy. Venesection, or the cutting of the vein for blood-letting, a practice not now nearly so much resorted to as a remedial measure as was formerly the case.

Phlegm. The popular appellation of mucus, as secreted in the expectoration from the air passages. The term used to be employed to express stupidity, because of the mistaken idea that persons specially subject to phlegm were thereby rendered dull.

Phlegmasia Dolens. Puerperal tumid leg, an affection incident to childbirth, alluded to under "Phlebitis," and commonly called "white leg." Due to the inflammatory condition of the veins and retardation of the return flow of the blood therein, it often proves obstinate, and medical aid should be sought for its alleviation.

Phlegmon. A tumour in the skin, red, tense, suppurating, and discharging pus at maturity. It is the outcome of an acute form of inflammation, such as in erysipelas, when slough has formed by reason of the virulence of the poison.

Phosphorus. An elementary body and a constituent of animals, as of the phosphate of lime in bone. Present also in the brain and in the fibres of flesh. It is a deadly and irritant poison, but when employed medicinally in small doses and introduced in a proper medium, phosphorus is beneficial in many forms of disease, particularly those of a neuralgic nature.

Phrenitis. Inflammation of the brain may arise from many causes, internal and symptomatic, or external and accidental. It is a disease of the greatest possible gravity, calling for the most careful medical treatment. (See **Brain**.)

Phthisis. Consumption, a wasting affection of the pulmonary organs or lungs, marked by cough, expectoration, sweats, hectic fever, and other distressing symptoms. There are many varieties of this dreadful scourge; pulmonary consumption proper, laryngeal phthisis, abdominal phthisis, or consumption of the bowels, tracheal phthisis, or consumption of the trachea; tubercular consumption and florid-hectic phthisis, or decline. (See **Consumption**.)

Phylisacium. A vivid red pustule of large size, followed by a dark coloured scab.

Piles. A painful disease arising from dilatation of the veins of the lower rectum on the edge of the anus, properly called hemorrhoids, piles are in the first instance a varicose condition of the hemorrhoidal veins. This excites inflammatory action and occasions strangulation and severe pain. The little tumours formed on and about the dilated veins burst and discharge blood with the evacuations at times; and the mucous membrane extruded from the anus becomes transformed into skin, when we get the condition called external piles. Any form or extent of this ailment is very painful and troublesome. Constipation and sluggish liver action are predisposing causes, and maternity contributes to their formation in other cases because of pressure which it brings to bear on the vessels of the pelvis. The great pile-preventative is full and free daily evacuation, and this must be systematically restored before there can be any lasting cure of hemorrhoidal trouble. Hazeline is a capital alleviating local application either as an ointment or a suppository and to this may be added in very painful cases some soothing agent such as conium ointment, or gall and opium ointment. When the piles are far and persistently obtruded their removal by operative treatment which is readily accomplished by surgeons nowadays is advisable.

Pimples are small rounded and more or less inflamed elevations of the skin, frequently suppurating at the head. The term is popularly applied to Acne (which see), and also describes the first stage of the eruption in small-pox.

"Pins and Needles" or "Leg Asleep," the curious tingling sensation which follows continuous pressure upon the nerve trunk of the arm or leg arises from the gradual recovery of nerve action after its temporary blunting, the successive "prickings" being the successive returns of the numerous nerve fibres to normal action.

Pituitary means that which secretes phlegm or mucus. Thus we have the pituitary membrane of the nose, and the pituitary gland of the brain. Pituitous signifies resembling phlegm.

Plethora. Repletion, over-fulness of the vessels of the body; hence we speak of a person of plethoric

habit when his blood-vessels are turgid and overloaded. The condition generally arises from indolence and excess of eating and drinking in combination with abstention from healthy exercise; and it tends to apoplexy and hæmorrhage. Thus it is the plethoric person who is most prone to bleeding from the nose, in the stomach, and from the lungs, a disagreeable experience which may possibly be a blessing in disguise, relieving the pressure on the brain which might have much more serious consequences.

Pleura. The serous membrane investing the lung, and covering the inner surface of the walls of the chest. It is covered with a lubricating fluid which in health enables the organs to move easily and without friction upon each other. When inflamed from any disturbing cause, however, the surface affected becomes roughened, and the condition of pleurisy or pleuritis is set up.

Pleurisy. Inflammation having roughened the surface of the lung or chest pleura, intense pain is occasioned. Pleurisy is generally, but not always, an accompaniment of disease within the lung substance proper. It commences with a short, dry cough, causing a sharp stabbing pain in the affected part. Shortly thereafter the character of the cough undergoes change, and each paroxysm is succeeded by the expectoration of rusty-coloured mucus, while there is invariably fever and high temperature. A blister may afford relief or leeches may be applied over the seat of pain, and phenacetin administered to allay the febrile disturbance, the patient's strength being maintained as far as possible by a plentiful milk dietary. When the pain is most intense, infinitesimal doses of opium and calomel may be given.

Pleurodynia or False Pleurisy. An inflammatory condition of the chest wall, often called "muscular rheumatism," occasioning a very acute pain, and frequently confounded with pleurisy proper, from which, however, it is distinguished by the absence of fever. It is generally the result of a weakened physical condition coincident with nervous prostration, and may be nothing more serious than an aggravated neuralgic affection of the intercostal nerves. Subcutaneous injection of morphia, and the administration of phenacetin combined with caffeine are likely to give prompt relief, and a liniment of menthol, chloroform, and menthol rubbed over the affected part, will prove beneficial. For the prevention of a recurrence of the attack a pill compounded of quinine, caffeine, and hop extract has been recommended.

Pleuro-Pneumonia. Simultaneous inflammation of the pleura and lungs.

Pleurorrhœa. Collection of fluid in the sacs of the pleura.

Pleurorhœpnea. Pain in the side, rendering the maintenance of the upright position necessary for breathing.

Pleurospasm. The spasm in the side so common in the case of hysterical females.

Plexus. A net-work of nerves, absorbents, or other vessels.

Plugging. Stuffing a wound or organ to prevent bleeding or discharge.

Pneumatocœle. Hernia distended with air, or formed by the protrusion of the lung through the thoracic wall.

Pneumatosis. A disease occasioned by the collection of air in the cellular texture under the skin.

Pneumolithiasis. Disease characterised by concretions in the lungs.

Pneumonia, or Inflammation of the Lungs. A very common and distressing disease, generally supervenes upon a bad chill, caught by a person at the time in a more or less debilitated condition generally. It is reckoned to be due to the existence of a specific germ, which may have long lain dormant in the system until the health of the individual was sufficiently impaired to permit of the development of its virulence, or it may have made its invasion at an opportune time for the immediate commencement of its disease-propagating activity. The characteristic symptoms of pneumonia are high fever, lividity of countenance, a hacking cough, and rapid breathing. Shortly there is viscid and rusty-coloured expectora-

tion. The chest over the seat of pain is invariably dull on percussion, and the stethoscope will reveal fine crepitation, which, as time goes on, grows more crackling in sound and later assumes a bubbling character. In pneumonia the great point of treatment is to keep the temperature down, relieving the local pain by blistering and maintaining the constitutional strength by nutritious dietary, careful attention being given to the prevention of any digestive disorder. The pneumonia patient should be confined to a warm but well-ventilated room; and when his pain is particularly troublesome it may be well to administer soothing medicine in which opium and calomel are compounded. There is a bilious form of pneumonia, and also a disease of less serious character arising from chest inflammation known as spurious pneumonia. A person who has once suffered from pneumonia should be particularly careful for the future to avoid chills and exposure. The disease is sometimes accompanied by and sometimes consequent upon bronchitis.

Podophyllin. A drug extracted from the resin of the dried underground stems of the American May-apple or mandrake. It is a valuable purgative and acts powerfully upon the liver. The tincture should be administered in small doses, and in combination with colocynth or some other purgative and an anodyne like morphia, powdered opium, or some other crumbly material being added to obviate griping. Thus podophyllin provides a safe substitute for mercury in combating bilious disorders.

Poliosis. Premature greyness of the hair.

Polypus. A tumour of morbid growth, attached to the interior of a mucous canal by a pedicle, and so called from the supposition that they have many feet. They occur in the larynx, fauces, nose, ear, rectum, and uterus, and vary in size from the smallest possible dimensions to that of a baby's head, or even larger. They may be gelatinous, fibrous, vesicular, or malignant, and partake very much of the nature of the surface from which the pedicle takes its origin. Usually they are removable by being laid hold of by forceps and twisted to their disconnection, and sometimes they are expelled without surgical interference by muscular action into the peritoneal cavity, and require extraction by abdominal section.

Pores of the skin should be kept constantly clear by cleanliness, and if they become clogged at all the penalty of neglect will have to be paid in illness. An active skin goes a long way to the maintenance of a healthy body.

Forrigo. A skin disease, developing crusts upon the scalp in which sero-purulent matter accumulates, popularly known, in various forms, as ringworm of the scalp, scald-head, honey-comb, etc. Cleansing of the affected surface with carbolic soap, and the application, after drying, of an ointment composed of red oxide of mercury in ordinary poultice, with the addition of quinine, is the treatment of this disagreeable ailment, to be repeated, night and morning, until it is eradicated.

Potash is a compound of oxygen and potassium, and therefore an oxide. It is largely used in medicine. Caustic potash in solution is employed as an antacid in various urinary diseases, besides being utilised for the destruction of morbid growths. Other potash salts serviceable in pharmacy are the carbonate and bi-carbonate, acetate, nitrate (saltpetre), bi-tartrate, chlorate, citrate and permanganate, all of which are referred to elsewhere.

Potassium enters into a great many useful medical combinations quite apart from those in which its oxides find employment. Thus the iodide and bromide are important in the treatment of constitutional disease, the former particularly in rheumatism, and the latter in brain and nervous affections.

Prolapus. A falling down, or falling out, of some part of the body, the term being usually employed to indicate falling of the womb, and bowel prolapsus, not uncommon in weakly children, particularly such as suffer from intestinal worm irritation. A gentle dabbing of the protruding part with cold water impregnated with lead extract, and the application of a suppository augmented by sponging of the hips and loins in salted water daily for a while, is good treatment. Tonic medicine should be administered simultaneously.

Prophylactic. A preventive medicine.

Protrusion of the Navel. When this occurs in an infant it is a good plan to cut a piece of cork or ivory into the shape of the half of a ball, and to press the convex side upon the protruded navel, retaining it in position with adhesive plaster, and gently securing with a body roller. The plaster should be changed every morning, and the skin carefully cleansed to prevent soreness. It may be necessary to continue the treatment for many weeks, especially in female children.

Prussic Acid. This is the old and familiar name of hydrocyanic acid, much employed, in minute quantity and chiefly in combination with other remedial agents, in medical practice; it is a very powerful sedative, and a most deadly poison. It exists in the kernels of all stone fruits, in the leaf of the laurel, and other vegetable substances, but is chiefly prepared chemically for pharmaceutical purposes from the cyanide of potassium.

Pseudæsthesia. Imaginary sense of touch, as in the remains of a limb from which a portion has been amputated, affording a feeling as if the removed part still remained.

Ptosis. Falling off of the eyelashes.

Puerperal Fever. a most distressing and perilous disease, is invariably due to neglect at a critical period on the part of the patient or her attendants. Its occasion is blood-poisoning, which should never occur in a confinement if antiseptic precautions be taken. It used always to be regarded as incurable, but even that has been changed by the advance of medical science, provided always that no loss of time be permitted before the removal of the cause of the mischief and the disinfection of the contaminated parts.

Pulmonary. This is the term applied to everything in connection with the lungs. The pulmonary arteries and veins are so called because they carry the blood to and from the lungs. "Pulmo" is the Latin word for "lung"; thus, we have pulmonary muscles, pulmonary nerves, pulmonary disease, etc. [See **Lungs** and **Consumption**.]

Pulp of the Tooth. This occupies the centre of the tooth and supplies nourishment thereto. When the pulp dies, the tooth loses its translucency, discolours, and decays.

Pulse. The beat or throbbing of the heart and arteries. The normal rate, in adults, averages about 70 per minute, and its increase, during fever, indicates the force of the latter, in which it soon times rises to as much as 120 to 140 per minute. At birth its average has been computed at 130 per minute; but it drops down to 88 by the time five years have been completed, to 78 when the "teens" commence, gradually subsiding to the mean till the age of twenty-five years has been attained, when it rises slightly again up to thirty years old, thereafter steadily to decline. In extreme age it will fall to 60, and sometimes to the feeble pace of 40 and even less.

Pupil. The "apple" of the eye, or transparent portion of the cornea, surrounded by the iris or coloured matter. The pupil, which is really a hole or aperture, is enlarged or diminished, according as the iris contracts or dilates. It permits light to pass directly through the lens to the retina.

Purpura. "The Purples," a kind of scurvy, consisting of spots or patches of a purple colour, resembling bruises; they are occasionally accompanied by a tendency to bleeding at the nose, and some feverishness. This ailment is indicative of want of tone, and morbid tincture of iron with quinine admixture may be taken advantageously, sulphate of magnesia being added should there be any tendency to constipation. Steel wine, with generous dietary, suffices for children.

Pus is the yellowish-white matter produced by inflammation, and discharged from the abscesses, granulating surfaces, ulcers, and open wounds. It may be "healthy" or "unhealthy." Laudable "pus" or "healthy matter" is a thick and creamy faint-odoured fluid, having an alkaline reaction, its composition being water, fat, albumen, some salts (chiefly common salt), and extractive matter. Really it is the blood in a vitiated condition from inflammatory disturbance, and abounding in white cells especially.

Pustule. Malignant, is due to the introduction of the poison of charbon or anthrax into the skin, and used always to be regarded as fatal. Latterly the subcutaneous introduction of antiseptics round the neighbourhood of the pustules has generally killed the parasite and ended the malady. (See **Anthrax**.)

Pustules are pimples which contain pus, and are due to decomposition in serum effused in limited area on the skin surface. Appearing first usually in the guise of clear vesicles, they presently put on a purulent form. The formation of pus, in these circumstances, is accompanied by high fever, wherever there is extensive eruption, as in small-pox.

Putrefaction. The decay and destruction of organised matter by chemical decomposition, with the consequent production of new compounds, generally gaseous in nature. This is a condition almost always perilous to human health and life.

Pyæmia. an old term signifying pus in the blood, but now called "blood poisoning," is always attended by high fever, which may abate only to come again with increased violence. It is due to poisoning through the absorption of germs. The suppuration affects the blood itself and gives rise to coagulation or clot in that fluid. This is reduced to pus, and sooner or later the patient succumbs to the septicæmia which results should the disease not be checked. Pyæmia commences with rigors and a very high temperature, followed by profuse perspiration.

Pylorus. The lower and right orifice of the stomach guarding the entrance to the bowels.

Pyogenesis. The formation of pus.

Pyretic. Medicine alleviating or removing fever.

Pyrosis or "Water Brash" is a consequence of indigestion, and is usually associated with heartburn. It is a most disagreeable disorder recognised by eructation of water fluid. Soups and stews will give rise to it in many cases where the stomach is not strong. Bismuth before meals, in ten grain doses, will usually ward it off.

Quartan. Designating the fourth, as quartan ague, when the intermittent attacks recur about once in every seventy-two hours.

Quicksilver. The metal mercury much used in medicine. (See **Mercury**.)

Quinine is the principal and highly important alkaloid obtained from the cinchona tree, and commonly called "Peruvian Bark." As an antidote for ague it has enormous beneficial use, and it is a valuable curative agent in neuralgia, a tonic in debility, and anti-pyretic in some fevers. Applied locally it is efficacious in eczema and other skin affections.

Quinsy a form of tonsillitis which has proceeded to suppuration, is a very painful throat affection indeed. It is frequent in persons subject to rheumatism, and sometimes immediately precedes an attack of rheumatic fever. Both tonsils are badly inflamed, and the uvula and part of the pharynx are generally implicated. The symptoms, apart from the actual inflammation, are a white-furred tongue, high feverishness, excessive difficulty and pain in swallowing, thirst, and great throat soreness. As the disease progresses, the swelling greatly increases, almost to suffocation point, when the crisis is reached and suppuration affords relief. Quinsy almost always comes when the health generally is low, and the appearance at such times of tonsillitis, it is advisable at once to take as a quinsy prophylactic salicin and chlorate of potash in guaiacum mixture. The inhalation of sulphurous acid is alleviative in actual quinsy, but the disease, once commenced, will usually have its course.

Rabies. Madness: hence rabid, generally applied to a dog supposed to be mad; and rabidness, the dreadful disease sometimes following its bite, otherwise called hydrophobia (which see).

Rachialgia. Pain in the spine; rachitic, ricketsy.

Radius. The bone of the forearm, reaching from the elbow to the wrist, so called because of its power of revolving round upon the ulna. The radius lies to the thumb side when the arm is held with the palm upward.

Ranula. A tumour under the tongue, an enlarged salivary gland, secreting a glairy fluid, and generally requiring surgical removal.

Rash. The popular term for many descriptions of skin affection, and especially to the eruptions and discolorations of scarlatina, measles, scarlet fever, nettle-rash, etc. It is supposed that the name arose from the sudden manner in which the eruptions sometimes appear in exanthematous disease.

Rattles. The characteristic sound of the breath struggle in croup, or the particularly impressive noise made by the parting breath of a dying person as it passes through mucus in the throat.

Rectum. The lowest part of the intestine, terminating at the anus. It is regularly cylindrical, contracting in transverse folds, and capable of very considerable distention.

Recurrent. Returning at intervals, as certain diseases or certain symptoms thereof.

Red Gum. A skin affection common in infancy, resembling eczema, and due to teething irritation. Tepid bathing, a fluid magnesia aperient, and a little zinc ointment should the irritation prove intractable, will generally set this ailment right.

Relapsing Fever. A fever differing materially from either typhus or typhoid. It is sometimes styled "famine fever," because of its propensity to attack the under-fed, and in Germany the disease is often called the "hunger pest." It begins with sudden shivering, frontal headache, and giddiness; proceeds to high fever, with hot skin, white furry tongue, rapid pulse, jaundice, sweatings, and delirium; while there are often as an accompanying feature nausea and vomiting, sleeplessness, pains in the back and muscles, and anxious expression. The fever will rage from five to eight days and when matters seem at a crisis a quick change will come of a surprising character, the fever subsiding, a profuse perspiration exuding from every pore of the pain-racked body, and every appearance of recovery be made manifest. But about the fourteenth day there will come a relapse to the former state of high fever with all the violent symptoms returning as suddenly as they left. This may again be repeated in a very exhaustive manner, the tendency to syncope being most marked in the sweating crisis. Stimulants should be given and restoratives kept always at hand. It takes the patient many weeks to get over relapsing fever and its effects, at the best.

Remittent Fever. This endemic fever differs from ague in there being no distinct intermissions, but frequently recurring attacks, chiefly in the early morning. The treatment is substantially similar to that proper in the case of ague, quinine being the staple medicine usually employed.

Respirators are instruments devised for the purpose of purifying the air before inspiration, and for protecting the air passages generally, especially in cold, damp or foggy weather. In case of difficult breathing and troublesome cough, soothing substances such as creosote, chloroform, menthol, etc., may be introduced into the respirator, with great relief.

Retching. the painful impulse to vomit which results in nothing further than the bringing into the mouth of mixed mucus and saliva, may generally be relieved by iced soda water; but obstinate retching may require a dose of hydrocyanic acid to correct it. This deadly poison should not be taken, however, unless and as prescribed by a doctor.

Retina. The internal coating or issue of the eye. It is a delicate, semi-transparent membrane, composed of the expansion of the optic nerve, its function being to receive the impressions of external objects and carry them on to the brain. When this portion of the visual machine gets out of order, we have the disease known as amaurosis, whilst dropsy behind the membrane may detach it from its matrix or a blood vessel may be ruptured within the retina itself. (See *Eyes*.)

Rhassary. A Persian root, a tincture of which is used in the treatment of chronic diarrhoea for its astringent properties. It may also be applied to spongy gums, and the powder makes a useful styptic in cuts and abrasions.

Rheum. An increased action of the muscles of any organ, the term generally being applied to that of the mucous glands; hence "rheumy."

Rheumatism. This very painful affliction parades of the character of both the diseases included

in its descriptive appellation, and attacks the hands and feet for the most part. There it becomes very difficult indeed to eradicate. If more gouty than rheumatic as to symptoms, the treatment should be a modification of that proper in gout; but if the rheumatic features predominate, then rheumatic remedies will be most likely to prove alleviative, and the salicin may be given a trial.

Rheumatism. An inflammatory or febrile affection that attacks the joints and muscles or their coverings and sheaths in various parts of the body. When the more important joints are involved by the most active form of this very painful disease, the seizure is known as rheumatic fever, because of its being accompanied by pronounced febrile conditions. Less active forms of rheumatism are styled sub-acute, chronic, or neuralgic. In the acute form the joints are so painfully sensitive to the slightest movement that the patient dreads the slightest movement of the bed-clothes. The joints are red and swollen, and a high degree of fever accompanies general functional derangement. The seat of inflammation changes rapidly from joint to joint, the pain returning to the joints from which it removed. In sub-acute rheumatism the symptoms are of a muscular character. Rheumatic headache and lumbago belong to this class. There is no fever in neuralgic rheumatism, and it is intermittent or periodic, but, at its worst, it is perhaps most excruciating of all. Rheumatic fever is apt to set up inflammatory action of the pericardium and the heart itself, attended by palpitation, and it is not infrequently preceded by tonsillitis. Constipation is considered to be an exciting cause of rheumatism; exposure to damp and violent changes of temperature tend to promote it, and it is undoubtedly often of hereditary origin. Salicine (which see) is a very valuable remedy in rheumatism, and its use has quite revolutionised the approved treatment of this painful malady. Residence in a dry soil district is desirable for rheumatic subjects, and the waters of Buxton and Bath are renowned for their alleviative effect in the ailment.

Rickets or Rachitis. A disease of childhood due to the deficiency in the solidarity of the bony substances rendering them insufficient to maintain the necessary weight of the parts of the body dependent upon them. Sometimes the bones become very painfully distorted, beyond straightening; but if a beginning be made soon enough and the little sufferer be carried away to live in pure country air or by the seaside and given generous feeding and a favourable regimen all round it may be very often rescued from crippledom. A good deal of lime water and milk, should be drunk for bone nutrition, and cod liver oil and steel wine given for constitutional up-building. Padded splints may be worn if really necessary, but rest and tonic treatment should obviate this as much as possible. A rickety balm should not be permitted to try to walk until its legs can stand the strain, or they will be malformed. Better be an invalid for a few weeks or months in early childhood than a cripple all through life.

Rigor or Shivers. is that unnatural condition—a consequence of some grave constitutional disturbance—in which a person with an abnormally high temperature has the impression of being very cold, and shivers accordingly. It usually presages fever associated with blood contamination or some severe inflammatory trouble. But Rigor may be attributable also to nervous irritation of a pronounced description, when it need not be regarded so seriously as if arising from septic influences. It is always an alarming thing, and should cause the calling in of the doctor, who will be able to diagnose the case and administer accordingly.

Ringworm. This ugly visitation arises from a fungoid growth of a contagious kind, which establishes itself within the hair follicles of the scalp, chiefly, in children, but may occur in the beard of man, or over any part of the body. There are several distinct varieties. Porrigo scutulata, "scald-head," is a common form. Herpes circinatus is the name given by medical writers to the ringworm of the body, that of the beard is called Syccosis; and Thinea tonsurans is the correct style of the scalp variety. All such hairy ringworms are easier to get than to get rid of. Those established in hairy tissue must be washed with carbolio

soap well, have all the hair cut away that, if possible, being plucked out by the roots. Then the sponging of the spots with bi-chloride of mercury in solution is recommended, two grains to the ounce of water. A more elaborate ointment and one often particularly effective, is one part of the oleate of zinc ointment to which has been added one-eighth part of aristol, mixed well with as much oleate of mercury as there is of zinc. Let this be well rubbed in night and morning and continue theunction for some days after the ringworm seems to have disappeared. A tonic, cod-liver oil and particularly nourishing diet may be tried. Sulphurous acid lotion, applied with a brush, will occasionally succeed in clearing off the facial or body ringworm.

Rose Rash. This slight febrile eruption is sometimes very difficult to distinguish at first from measles, and in other cases closely resembles the beginning of scarlet fever; but the constitutional disturbance accompanying the eruption is relatively slight, and it is very soon certain that rose rash is only the trifling affection, which will yield to careful dietary and a little dabbling with vinegar and water.

Rupture. An eruptive disease characterised by broad and flat vesicles, the scales of which are easily rubbed off and reproduced.

Rupture. The protrusion of one or other portion of the bowel or any of the contents of the abdominal cavity. In the groin it is called inguinal hernia, the most frequent phase; at a lower level we get femoral hernia. There is umbilical hernia also at the navel, most common in women who have experienced maternity. Rupture may be congenital or acquired, and when a baby is born with hernia anywhere a truss should be obtained for it, and it may very likely outgrow the abnormal condition. A rupture occasioned by strain will after return usually have to be kept in place by the constant wearing of a properly fitted truss. A rupture, wherever and whenever it occurs, should not be neglected, or it will be likely to become strangulated, a perilous condition and one occasioning much suffering and, if not like operative surgical treatment. Antiseptic surgery and chloroform have rendered it less likely for fatality to follow even the worst kinds of rupture; but delay may occasion gangrene, with the impossibility of preventing the worst. Trusses should always be most carefully fitted, both for safety and comfort's sake, and chosen under the direction of the surgeon who has reduced the rupture.

S. S. Vitus's Dance, technically called "chorea," and in France "Dance of St. Guy." This peculiar distressing ailment is undoubtedly of nervous origination. Its manifestation is inability to direct and control the action of the voluntary muscles, and it is chiefly found in young persons constitutionally debilitated. The characteristic twitching of the muscles of the neck and face, particularly in the neighbourhood of the mouth, precede more active symptoms of erratic limb motion which, with the ungovernable grimaces of the poor patient, are pitiable to behold. Let the nerves be soothed by valerianate of zinc prepared, but try to get at the root of the mischief by attacking the cause. Medical men prescribe arsenic as a typical remedy in this ailment. Vigorous and thorough handling of the case whilst the person suffering is of tender years should result in the eradication of the disease. If St. Vitus's Dance is seen in a chronic condition in puberty, it often becomes quite intractable. Chorea often occurs after a fright. This curious ailment in olden days was the subject of much ignorant superstition, the poor sufferer therefrom being regarded as "possessed of a devil."

Salicic Acid is a wonderful drug, which, if all that is claimed for it be correct, should be the saviour of untold suffering. It has been held by physicians of the newer school—who therein only follow certain believers in "simples"—to furnish a specific in rheumatism, and it undoubtedly often proves palliative in this painful affection. Salicin is a crystalline substance obtained from the bark of the willow tree, and one of the sources from which salicylic acid is prepared. It makes a most bitter pill or potion, and is in several respects not without affinity to quinine, the active principle of cinchona, the ague specific. Salicylic acid is useful in medicine as well as in the arts and the

manufacturing world, and comes in very useful in the dressing of wounds. There are those who swear by salicin in tonsillitis and all rheumatic ailments, where salicylate of soda is also valuable.

Saliva, the secretion of the salivary glands, which moisten the mouth and assist mastication to prepare the food for swallowing, and for the action of the gastric juices and other digestive fluids. Exuded by the glands surrounding the gums, which are stimulated by chewing into activity, saliva quickly changes the starchy constituents of our food into glucose (a form of sugar). To "make one's mouth water" is to start the saliva flow, setting at liberty the powerful ptyalin that can transform diastase and starch into digestible sugar instantly, and so act as a preventive of acidity and flatulence. The salivary glands consist of the parotids in front of the ears, where the "mumps" make mischief with children sometimes; the sub-maxillary, under the jaw angles; and the sublingual, below the tongue. Each has a discharging duct.

Salivation, the excessive secretion of saliva, produced by mercurial overdosage, by iodide of potassium, or too extensive medicinal administration, or by diseased conditions of the nervous system. A very little mercury will salivate some folk; others may swallow much with impunity. Salivation is accompanied by great gum soreness. The way to correct it is to use astringent gargles, and relieve the prostration, which frequently follows, by generous tonic treatment.

Salol comes from coal tar, and its solution makes a remedial lotion for inflamed rheumatic joints, while sometimes it is administered internally in 5 to 15 grain doses for the relief of fever and rheumatic attacks with good effect, though in other and apparently similar cases it will fail altogether. It is also used to correct fermentation of the food in the bowels.

Sal Frunella. Purified saltpetre, an antiquated but long popular sore-throat remedy.

Salt (Chloride of Sodium) is a natural and necessary stimulant to the digestive functions, secreted in the mother's milk. With milk in some form, that most commonly used is the chloride of sodium—otherwise nutritive food could not be solved and absorbed, and the whole human race, civilised and savage, is aware of its indispensability. It is not, generally speaking, given to infants and children quite so freely as is desirable for the maintenance of the best health conditions. It is found abundantly on land and in water, and wherever it may by circumstance become scarce, it is a commodity of priceless value.

Salt of Tartar. Carbonate of potash in an impure state. An old name for a cleansing substance.

Saltpetre. The nitrate of potash, or nitre, used in India and elsewhere in the composition of a cooling mixture. It has diuretic properties, but can scarcely be classed as a safe and altogether desirable medicine.

Salts. Salts, properly speaking, are the result of the combination of an acid with a base, as Epsom salts, Glauber's Salts, and, strange to say, the "salt of the earth"—the salt of all salts, the common salt of every household, is but a compound of chlorine and the metal sodium.

Sal Volatile. Carbonate of ammonia, a solution of ammonia in spirits of wine, a very valuable stimulant and antiseptic, and an admirable restorative agent in the treatment of fainting hysteria, asphyxia by drowning or hanging, prussic acid poisoning, etc.; also an alleviative of flatulency.

Santonin, the active principle of wormwood, is poisonous to round worm and to thread worms, the last troublesome parasites to children. A two-grain dose, preceded and followed by castor oil, and given in milk, will usually—if repeated at intervals of eight or twelve hours—succeed in banishing these irritating little pests, which are often accountable for convulsions.

Sarcina Ventriculi. Very undesirable fungoid developments present in highly acid conditions of the stomach secretions, and the outcome of pronounced dyspeptic disorders. The fungus is apt to attack those whose dietary has a vegetable bias, and it is often accompanied by depression and irritability with a general inclination towards morbidity. Hypophosphate of soda will destroy the vitality of the growth, but

treatment should be addressed to the invigoration of the stomach and digestive system.

Sassafras. A stimulating sweat-producer in rheumatic and some skin ailments; generally given in combination with guaiacum and saraparilla. Sassafras should not be taken without the doctor's orders.

Savin makes a stimulating ointment, and, indeed, is so irritant in some cases as to be called into requisition for blistering purposes. Internally it has been administered for the correction of menstrual irregularities, but must only be used by a medical man.

Scabies. A synonym of "itch," the ailment being attributable to the minute mite "Acarus scabies." This disagreeable disorder used to be called the "seven years' itch," because of the difficulty experienced in its eradication. The "Acarus" is microscopic, but marvellously instinct with vitality. A single female, finding its way to the finger-roots at the back of the hand, will produce a family of tens of thousands in a few weeks, if unmolested, and give rise to multitudinous pimples of a most irritating character. (See Itch.)

Scald Head. An eruptive pustular scalp affection, forming incrustations of a loathsome and offensive character, and due to a fungoid growth induced by dirt and unwholesome dietary surroundings. There is much irritation and a peculiarly unpleasant odour is emitted. The crusts should be softened by the application of a bran poultice and an ointment of oleate of mercury and oleate of zinc, rubbed in night and morning after cleansing and cutting the hair closely. Simultaneously alterative powders of a suitable character should be administered.

Scalds. Apply a handful of crushed common washing soda, under a folded cloth, preferably of linen, steeped in, and wrung out of cold water. Let these remain on until the severe pain is allayed. Afterwards anoint with a liniment made from the raw white of eggs, or smear with olive or linseed oil, which may be dressed upon the part plain, or mixed with fine whiting or powdered chalk, dusted over the oil with a kitchen flour dredger. Bandage to further exclude the air.

Scalp. The scalp and skin of the head is denser and thicker than the integument of the body generally, and connected by cellular tissue with the parts immediately below. The scalp is largely supplied with blood vessels, hence the profuse hemorrhage which sometimes issues from a severe scalp wound. In treating such, it is necessary to cut or shave away the hair closely for some distance around the injured part, washing the wound with some antiseptic solution, and drawing the cut edges together with adhesive plaster dipped in boiling water. Apply a hot pad and bandage. The stitching of a scalp wound is inadvisable because of the risks of inflammation.

Scapula. The shoulder blade, which serves to connect the arm with the trunk and gives attachment to many of the muscles by which the former is put in motion. It is a broad, flat, triangular bone, over the back of which a ridge runs for the attachment of the muscles alluded to.

Scarf Skin. The epidermis or cuticle, the upper layer of the skin, liable to numerous affections, such as eczema, psoriasis, pityriasis, &c., which see.

Scarification. Incision of the skin by the lancet or other sharp instrument. This is necessary for vaccination, and is frequently resorted to upon the gums of children in teething troubles; also elsewhere for the relief of adjacent congested tissue.

Scarlatina. The term usually applied to a mild form of scarlet fever; but it should never be forgotten that the malady has the same origin and characteristics as the more virulent type of the disease, and even when the attack is what is styled favourable, it may be followed by dangerous complications, so that the convalescent stage requires very careful watching.

Scarlet Fever. The full and pronounced phase of scarlatina, differing therefrom only in intensity; is an eruptive febrile malady liable to attack children of any age, and common also in adults. Sometimes scarlet fever is epidemic and will prove prevalent in waves; that is to say, there may be many cases in a district at about one period, and, after the force of the attack has spent itself, immunity for months and years,

No doubt the disease is propagated by a specific germ, which may be carried in milk or in the air, and is very highly infectious. The fever is preceded by languor, pains in the back and head, and cold chills, the forerunners of all kinds of febrile disorders; but the special symptoms of scarlatina and scarlet fever are difficulty in swallowing, hoarseness, pronounced throat soreness, and peculiar speckled or "strawberry" appearance of the tongue, the papillae standing out bright scarlet, from the edges of the tongue being also very red. There is a great thirst, difficult breathing, and high temperature, with more or less enlargement of the glands of the neck; succeeded by a characteristic rash, commencing on the forehead and face about the third day, and extending to the neck, shoulders, and trunk, until the entire skin assumes the resemblance, as to colour, of a boiled lobster. When the eruption is complete, the urgency of the febrile symptoms gradually abates, and at the seventh day the cuticle begins to peel off in dust and flakes and sometimes even in large pieces, the outer skin of the fingers coming away occasionally like the fingers of a glove. The temperature of the tongue on the tenth day changes to a uniform beefy red, and should the disease take thereafter a favourable course there will be steady recovery, though very great care is requisite during the desquamation period to prevent chill, the new skin being most susceptible. In malignant scarlet fever the shock to the system is so extensive and violent as gravely to endanger life, and dropsy is a frequent sequel. When the throat mischief is aggravated, poulticing will be necessary; for the rest the low diet of fever generally and particularly careful nursing are essential in scarlet fever, with the most unremitting attention to disinfectant precautions. Free ventilation is very requisite.

Sciatica is really rheumatism, occasioning acute neuralgia of the sciatic nerve (or of its sheath), the largest in the human body. Not only the trunk of the nerve in hip and thigh will be affected by excruciating and temporarily prostrating pain, but the branches supplying the calf of the leg and foot are frequently affected. Disabling the sufferer from moving about and very seriously interfering with his rest, this particularly punishing malady is not dangerous to life, and is due to the fact that the sciatic nerve sheath is congested by rheumatic agency, and presses upon the extensive and sensitive vessel. Any blood in the area, contribute to the onset of sciatic, especially where the rheumatic tendency is existent; and treatment should commence with the endeavour to combat the cause of disturbance. If it be constipation the lower bowel must at once be cleared, and kept regularly clear, the blood being freed from the fecal matter it has absorbed. The general health must have attention, for a debilitated condition may of itself induce sciatica in cases. The supplementary treatment is as for rheumatism proper; and counter-irritation may be resorted to locally for the relief of the acute nerve pain during the general curative process. Cutaneous injection of morphia is sometimes insisted upon by the sufferer, because of the practical certainty it affords of temporary sure ease from nerve torture; but this treatment is to be deprecated, save in very exceptional circumstances, the proper thing being to drive away the pain by removing its occasion, and not merely to deaden it by the administration of a potent drug. Salicin is an important remedial agent in effecting requisite blood reform in sciatica as mentioned in the general article on rheumatism; and phosphorus in the food will be found helpful.

Scirrhus signifies a hard tumour, occurring in any part. The condition is commonest in the breasts, a form of cancer, and when surgically interfered with in a timely way will frequently be prevented from ramification to surrounding tissue. Nothing short of the knife is scarcely eradicated of scirrhusoid affection, and there must be no procrastination.
